DOCUMENTATION

1	Installation	3
1.1	aisquared	3
1.1.1	aisquared package	3
1.1.1.1	Subpackages	3
1.1.1.2	Module contents	71
2	Changelog	73
	Python Module Index	77
	Index	79

This package contains utilities to interact with the AI Squared technology stack, particularly with developing and deploying models to the AI Squared Platform or other applications developed through the AI Squared JavaScript SDK.

Current Production Version: 0.3.11

[View this Documentation in PDF Format.](#)

INSTALLATION

This package is available through [Pypi](#) and can be installed by running the following command:

```
pip install aisquared
```

Alternatively, the latest version of the software can be installed directly from GitHub using the following command:

```
pip install git+https://github.com/AISquaredInc/aisquared
```

1.1 aisquared

1.1.1 aisquared package

1.1.1.1 Subpackages

aisquared.base package

Submodules

aisquared.base.BaseObject module

class aisquared.base.BaseObject.**BaseObject**

Bases: object

Base class used for all other classes within the aisquared package. This class is not meant to be used by any end user of this package, but is rather used throughout this package as a parent class.

to_dict() → dict

Get the object as a dictionary

to_json() → str

Return the object as a json string

aisquared.base.css module

aisquared.base.endpoints module

NOT MEANT TO BE CALLED BY THE END USER - configuration parameters for the different endpoints in the platform

aisquared.base.harvesting module

Some allowed configuration parameters - not designed to be directly called by the user

aisquared.base.platform module

aisquared.base.preprocessing module

Some allowed configuration parameters - not designed to be directly called by the user

aisquared.base.rendering module

Some allowed configuration parameters - not meant to be directly called by the end user

aisquared.base.stages module

Some allowed configuration parameters - not designed to be directly called by the user

Module contents

The aisquared.base package contains both some basic objects that are used across the aisquared package backend and some objects which are designed to facilitate simple use cases of the technology.

aisquared.config package

Subpackages

aisquared.config.analytic package

Submodules

aisquared.config.analytic.DeployedAnalytic module

```
class aisquared.config.analytic.DeployedAnalytic.DeployedAnalytic(url: str, method: str,  
                                                                    input_type: str, headers: dict |  
                                                                    None = None, body: dict |  
                                                                    None = None, data_type: str  
                                                                    = 'string')
```

Bases: *BaseObject*

Interaction with a remote endpoint.

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.DeployedAnalytic(
    'model_url',
    'POST',
    'text',
    {
        'Content-Type' : 'application/json'
    },
    {
        'data_to_be_sent' : '{{input}}'
    },
    'string'
)
>>> analytic.to_dict()
{'className': 'DeployedAnalytic',
 'params': {'url': 'model_url',
 'method': 'POST',
 'inputType': 'text',
 'headers': {'Content-Type': 'application/json'},
 'body': {'data_to_be_sent': '{{input}}'}}
 'dataType': 'string'}
```

property body

property data_type

property headers

property input_type

property method

to_dict() → dict

Get the object as a dictionary

property url

aisquared.config.analytic.DeployedModel module

```
class aisquared.config.analytic.DeployedModel.DeployedModel(url: str, input_type: str, headers: dict
    | None = None, body_key: str | None
    = None, return_key: str | None =
    None, body_setup: dict | None =
    None, body_setup_replace_value: str
    = '{DATAPOINT}')
```

Bases: *BaseObject*

Interaction with a remote model

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.DeployedModel(
    'model_url',
    'text'
)
>>> analytic.to_dict()
{'className': 'DeployedModel',
 'params': {'url': 'model_url',
 'inputType': 'text',
 'headers': None,
 'bodyKey': None,
 'returnKey': None,
 'bodySetup': None,
 'bodySetupReplaceValue': None
 }}
```

property body_key

property body_setup

property body_setup_replace_value

property headers

property input_type

property return_key

to_dict() → dict

Get the config object as a dictionary

property url

aisquared.config.analytic.LocalAnalytic module

class aisquared.config.analytic.LocalAnalytic.**LocalAnalytic**(*path: str, input_type: str, all: bool = False*)

Bases: *BaseObject*

Interaction with an analytic (lookup table) saved to the local file system

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.LocalAnalytic(
    'analytic_path',
    'text'
)
>>> analytic.to_dict()
{'className': 'LocalAnalytic',
 'params': {'path': 'analytic_path',
 'inputType': 'text',
 'all': False}}
```

property all

property input_type

property path

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.analytic.LocalModel module

class aisquared.config.analytic.LocalModel.**LocalModel**(*path: str, input_type: str*)

Bases: [BaseObject](#)

Interaction with a model currently saved to the local file system

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.LocalModel(
    'model_path',
    'text'
)
>>> analytic.to_dict()
{'className': 'LocalModel',
 'params': {'path': 'model_path',
            'inputType': 'text'}}
```

property input_type

property path

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.analytic.ReverseMLWorkflow module

```
class aisquared.config.analytic.ReverseMLWorkflow.ReverseMLWorkflow(label: str, connector_type: str, connector_action: str = 'read', input_type: str = 'text', filter_type: str = 'input', file_names: list = [], bucket: str = "", filter_by_columns: list = [], all: bool = False, arn: str = "", host: str = "", path: str = "", port: str = "", role: str = "", soql: str = "", query: str = "", token: str = "", column: str = "", db_name: str = "", db_user: str = "", period: int | None = None, schema: str = "", secret: str = "", account: str = "", data_map: list = [], db_table: str = "", client_id: str = "", file_name: str = "", password: str = "", schedule: str = "", sync_keys: dict = {'destination': "", 'source': ""}, warehouse: str = "", data_source: str = "", cluster_name: str = "", client_secret: str = "", organization: str = "", authentication_type: str = "")
```

Bases: *BaseObject*

Creation of a ReverseML Workflow to interact with remote data sources

to_dict() → dict

Get the configuration object as a dictionary

Module contents

The `aisquared.config.analytic` subpackage contains objects for packaging individual analytics.

aisquared.config.feedback package

Submodules

aisquared.config.feedback.BinaryFeedback module

class `aisquared.config.feedback.BinaryFeedback.BinaryFeedback(label_map: list)`

Bases: `BaseObject`

Feedback for binary classification

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.BinaryFeedback(['class1', 'class2'])
>>> my_obj.to_dict()
{'className': 'BinaryFeedback', 'params': {'labelMap': ['class1', 'class2']}}
```

property `label_map`

to_dict() → dict

Return the object as a dictionary

aisquared.config.feedback.ModelFeedback module

class `aisquared.config.feedback.ModelFeedback.ModelFeedback`

Bases: `BaseObject`

Feedback object for questions and answers for an individual model.

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.ModelFeedback()
>>> my_obj.add_question(
    'How is the model performing?',
    choices = ['very poorly', 'poorly', 'neutral', 'well', 'very well']
)
>>> my_obj.add_question(
    'Any additional feedback?',
    'text'
)
>>> my_obj.to_dict()
{'className': 'ModelFeedback',
 'params': {'questions': [{'question': 'How is the model performing?',
 'answerType': 'singleChoice',
 'choices': ['very poorly', 'poorly', 'neutral', 'well', 'very well']},
 {'question': 'Any additional feedback?', 'answerType': 'text'}]}}
```

add_question(*question: str, answer_type: str = 'singleChoice', choices: list = []*)

Add a question to be asked.

Parameters

- **question** (*str*) – The question to be asked.
- **answer_type** (*str (default 'singleChoice')*) – One of either 'singleChoice', 'multiChoice', or 'text'
- **choices** (*list (default [])*) – The choices to be provided, if *answer_type* is 'singleChoice' or 'multiChoice'

to_dict() → dict

Return the object as a dictionary

aisquared.config.feedback.MulticlassFeedback module

class aisquared.config.feedback.MulticlassFeedback.MulticlassFeedback(*label_map: list*)

Bases: *BaseObject*

Feedback for multiclass classification

Example Usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.MulticlassFeedback(['class1', 'class2',
↪ 'class3'])
>>> my_obj.to_dict()
{'className': 'MulticlassFeedback',
'params': {'labelMap': ['class1', 'class2', 'class3']}}
```

property label_map

to_dict() → dict

Return the object as a dictionary

aisquared.config.feedback.QualitativeFeedback module

class aisquared.config.feedback.QualitativeFeedback.QualitativeFeedback

Bases: *BaseObject*

Feedback object for questions and answers for individual predictions.

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.QualitativeFeedback()
>>> my_obj.add_question('Any additional feedback?', 'text')
>>> my_obj.to_dict()
{'className': 'QualitativeFeedback',
'params': {'questions': [{'question': 'Any additional feedback?',
'answerType': 'text'}]}}
```

add_question(*question: str, answer_type: str = 'singleChoice', choices: list = []*)

Add a question to be asked.

Parameters

- **question** (*str*) – The question to be asked.
- **answer_type** (*str (default 'singleChoice')*) – One of either 'singleChoice', 'multiChoice', or 'text'
- **choices** (*list (default [])*) – The choices to be provided, if *answer_type* is 'singleChoice' or 'multiChoice'

to_dict() → dict

Return the object as a dictionary

aisquared.config.feedback.RegressionFeedback module

class aisquared.config.feedback.RegressionFeedback.**RegressionFeedback**

Bases: *BaseObject*

Feedback for regression

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.RegressionFeedback()
>>> my_obj.to_dict()
{'className': 'RegressionFeedback', 'params': {}}
```

to_dict() → dict

Return the object as a dictionary

aisquared.config.feedback.SimpleFeedback module

class aisquared.config.feedback.SimpleFeedback.**SimpleFeedback**

Bases: *BaseObject*

Simple thumbs-up/thumbs-down feedback for predictions

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.SimpleFeedback()
>>> my_obj.to_dict()
{'className': 'SimpleFeedback', 'params': {}}
```

to_dict() → dict

Return the object as a dictionary

Module contents

The `aisquared.config.feedback` subpackage contains objects for configuring feedback in `aisquared` models.

`aisquared.config.harvesting` package

Submodules

`aisquared.config.harvesting.ChatbotHarvester` module

```
class aisquared.config.harvesting.ChatbotHarvester.ChatbotHarvester(title,  
                                                                    harvest_history=False,  
                                                                    input_type='text',  
                                                                    features=None,  
                                                                    max_length=None)
```

Bases: *BaseObject*

Harvesting for a chatbot

to_dict()

Return the configuration object as a dictionary

`aisquared.config.harvesting.ImageHarvester` module

```
class aisquared.config.harvesting.ImageHarvester.ImageHarvester(how: str = 'all')
```

Bases: *BaseObject*

Object to harvest images

Example usage:

```
>>> import aisquared  
>>> my_obj = aisquared.config.harvesting.ImageHarvester()  
>>> my_obj.to_dict()  
{'className': 'ImageHarvester', 'params': {'how' : 'all'}}
```

property how

to_dict() → dict

Get the configuration object as a dictionary

`aisquared.config.harvesting.InputHarvester` module

```
class aisquared.config.harvesting.InputHarvester.InputHarvester(input_type: str = 'text',  
                                                                    max_length: int | None = None,  
                                                                    features: list | None = None)
```

Bases: *BaseObject*

Object to harvest user-input text

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.InputHarvester()
>>> my_obj.to_dict()
{'className': 'InputHarvester',
 'params': {'inputType': 'text', 'maxLength': None, 'features': None}}
```

property features

property input_type

property max_length

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.harvesting.QueryParameterHarvester module

```
class aisquared.config.harvesting.QueryParameterHarvester.QueryParameterHarvester(query_keys:
                                                                 str | list,
                                                                 url_locations:
                                                                 str | list,
                                                                 at-
                                                                 tributes:
                                                                 str | list)
```

Bases: *BaseObject*

Harvester for Query Parameters

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.QueryParameterHarvester(
    'test_key',
    'test_url',
    'test_attribute'
)
>>> my_obj.to_dict()
{'className': 'QueryParameterHarvester',
 'params': {'queryKeys': ['test_key'],
 'urlLocations': ['test_url'],
 'attributes': ['test_attribute']}]}
```

property attributes

property query_keys

to_dict() → dict

Get the configuration object as a dictionary

property url_locations

aisquared.config.harvesting.TextHarvester module

class aisquared.config.harvesting.TextHarvester.**TextHarvester**(*how: str = 'all', regex: str | None = None, flags: str = 'gu', body_only: bool = False, keywords: str | list | None = None, limit: int | None = None*)

Bases: *BaseObject*

Object to harvest text

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.TextHarvester(
    how = 'all',
    body_only = True
)
>>> my_obj.to_dict()
{'className': 'TextHarvester',
 'params': {'how': 'all',
 'regex': None,
 'flags': 'gu',
 'bodyOnly': True,
 'limit': None}}
```

property body_only

property flags

property how

property limit

property regex

to_dict() → dict

Get the configuration object as a dictionary

Module contents

The aisquared.config.harvesting subpackage contains objects for configuring harvesting of data.

aisquared.config.postprocessing package

Submodules

aisquared.config.postprocessing.BinaryClassification module

class aisquared.config.postprocessing.BinaryClassification.**BinaryClassification**(*label_map: list, threshold: float = 0.5*)

Bases: *BaseObject*

Postprocessing configuration object for binary classification

Example usage

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.BinaryClassification(
    ['class1', 'class2']
)
>>> my_obj.to_dict()
{'className': 'BinaryClassification',
 'params': {'labelMap': ['class1', 'class2'], 'threshold': 0.5}}
```

property label_map

property threshold

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.postprocessing.MulticlassClassification module

class aisquared.config.postprocessing.MulticlassClassification.**MulticlassClassification**(label_map: list)

Bases: *BaseObject*

Postprocessing configuration object for multiclass classification

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.MulticlassClassification(
    ['class1', 'class2', 'class3']
)
>>> my_obj.to_dict()
{'className': 'MulticlassClassification',
 'params': {'labelMap': ['class1', 'class2', 'class3']}}
```

property label_map

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.postprocessing.ObjectDetection module

class aisquared.config.postprocessing.ObjectDetection.**ObjectDetection**(label_map: list, threshold: float = 0.5)

Bases: *BaseObject*

Postprocessing configuration object for object detection

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.ObjectDetection(
    ['class1', 'class2', 'class3']
)
>>> my_obj.to_dict()
{'className': 'ObjectDetection',
 'params': {'labelMap': ['class1', 'class2', 'class3'], 'threshold': 0.5}}
```

property label_map

property threshold

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.postprocessing.Regression module

```
class aisquared.config.postprocessing.Regression.Regression(min: int | float | None = None, max:
                                                            int | float | None = None, round: bool
                                                            = False)
```

Bases: *BaseObject*

Postprocessing configuration object for Regression

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.Regression(
    10,
    100
)
>>> my_obj.to_dict()
{'className': 'Regression', 'params': {'min': 10, 'max': 100, 'round': False}}
```

property max

property min

property round

to_dict() → dict

Get the configuration object as a dictionary

Module contents

The `aisquared.config.postprocessing` subpackage contains objects for configuring how predictions are postprocessed.

aisquared.config.preprocessing package

Subpackages

aisquared.config.preprocessing.image package

Submodules

aisquared.config.preprocessing.image.ImagePreprocessing module

class aisquared.config.preprocessing.image.ImagePreprocessing.**ImagePreprocessor**(*steps: list | None = None*)

Bases: *BaseObject*

Preprocessor object for image data

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.AddValue(255.0)
)
```

add_step(*step*)

Add a step to the preprocessor object

property **step_dict**

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.preprocessing.image.Steps module

class aisquared.config.preprocessing.image.Steps.**AddValue**(*value: int | float*)

Bases: *BaseObject*

Preprocessing step to add a value to all pixels in an image

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.AddValue(255.0)
)
```

to_dict() → dict

Get the configuration object as a dictionary

property **value**

class aisquared.config.preprocessing.image.Steps.**ConvertToColor**(color: str)

Bases: *BaseObject*

Preprocessing step to convert images to a color scheme

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.ConvertToColor('RGB')
)
```

property color

to_dict() → dict

Get the configuration object as a dictionary

class aisquared.config.preprocessing.image.Steps.**DivideValue**(value: int | float)

Bases: *BaseObject*

Preprocessing step to divide all pixels in an image by a value

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.DivideValue(255.0)
)
```

to_dict() → dict

Get the configuration object as a dictionary

property value

class aisquared.config.preprocessing.image.Steps.**MultiplyValue**(value: int | float)

Bases: *BaseObject*

Preprocessing step to multiply all pixels in an image by a value

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.MultiplyValue(2.0)
)
```

to_dict() → dict

Get the configuration object as a dictionary

property value

class aisquared.config.preprocessing.image.Steps.**Resize**(size: list, method: str = 'bilinear',
preserve_aspect_ratio: bool = False)

Bases: *BaseObject*

Preprocessing step to resize an image

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.Resize([100, 100])
)
```

property method

property preserve_aspect_ratio

property size

to_dict() → dict

Get the configuration object as a dictionary

class aisquared.config.preprocessing.image.Steps.**SubtractValue**(value: int | float)

Bases: *BaseObject*

Preprocessing step to subtract a value from all pixels in an image

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.image.SubtractValue(255.0)
)
```

to_dict() → dict

Get the configuration object as a dictionary

property value

Module contents

The `aisquared.config.preprocessing.image` subpackage contains objects for configuring image preprocessing.

aisquared.config.preprocessing.tabular package

Submodules

aisquared.config.preprocessing.tabular.Steps module

class aisquared.config.preprocessing.tabular.Steps.**DropColumn**(column: int)

Bases: *BaseObject*

Drop a column from tabular data

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.tabular.TabularPreprocessor()
>>> preprocessor.add_step(
```

(continues on next page)

(continued from previous page)

```
aisquared.config.preprocessing.tabular.DropColumn(  
    3  
)  
)
```

property column

to_dict() → dict

Get the configuration object as a dictionary

class aisquared.config.preprocessing.tabular.Steps.**MinMax**(*mins: list, maxs: list, columns: list | None = None*)

Bases: [BaseObject](#)

Min-Max Scaling preprocessing step

Min-Max Scaling takes all associated columns and maps values relative to the minimum and maximum values of the training data.

Example usage:

```
>>> import aisquared  
>>> preprocessor = aisquared.config.preprocessing.tabular.TabularPreprocessor()  
>>> preprocessor.add_step(  
    aisquared.config.preprocessing.tabular.MinMax(  
        [0, 1.1, 2],  
        [0.2, 14, 18.3]  
    )  
)
```

property columns

property maxs

property mins

to_dict() → dict

Get the configuration object as a dictionary

class aisquared.config.preprocessing.tabular.Steps.**OneHot**(*column: int, values: list*)

Bases: [BaseObject](#)

One Hot encoding preprocessing step

Example usage:

```
>>> import aisquared  
>>> preprocessor = aisquared.config.preprocessing.tabular.TabularPreprocessor()  
>>> preprocessor.add_step(  
    aisquared.config.preprocessing.tabular.OneHot(  
        6,  
        ['one', 'two', 'three']  
    )  
)
```

property column

to_dict() → dict

Get the configuration object as a dictionary

property values

class aisquared.config.preprocessing.tabular.Steps.**ZScore**(*means: list, stds: list, columns: int | list | None = None*)

Bases: *BaseObject*

Z-Score normalization preprocessing step

Z-Score normalization takes each supplied column value, subtracts that column's provided mean, and divides by the provided standard deviation.

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.tabular.TabularPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.tabular.ZScore(
        [0, 1, 2],
        [0.2, 0.4, 0.6]
    )
)
```

property columns

property means

property stds

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.preprocessing.tabular.TabularPreprocessing module

class aisquared.config.preprocessing.tabular.TabularPreprocessing.**TabularPreprocessor**(*steps: list | None = None*)

Bases: *BaseObject*

Preprocessor object for tabular data

Example usage:

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.tabular.TabularPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.tabular.ZScore(
        [0, 1, 2],
        [0.2, 0.4, 0.6]
    )
)
```

add_step(*step*)

Add a step to the preprocessor object

to_dict()

Get the configuration object as a dictionary

Module contents

The `aisquared.config.preprocessing.tabular` subpackage contains objects for preprocessing tabular data.

`aisquared.config.preprocessing.text` package

Submodules

`aisquared.config.preprocessing.text.Steps` module

class `aisquared.config.preprocessing.text.Steps.ConvertToCase`(*lowercase: bool = True*)

Bases: `BaseObject`

Text preprocessing object to convert inputs to all lowercase or all uppercase

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.text.ConvertToCase()
)
```

property `lowercase`

to_dict() → dict

Get the configuration object as a dictionary

class `aisquared.config.preprocessing.text.Steps.ConvertToVocabulary`(*vocabulary: dict*,
start_character: int = 1,
oov_character: int = 2,
max_vocab: int | None = None)

Bases: `BaseObject`

Text preprocessing object to convert tokens to integer vocabularies

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.text.ConvertToVocabulary(
        {
            'test' : 3,
            'vocabulary' : 4
        }
    )
)
```

(continues on next page)

(continued from previous page)

```
)
)
```

property max_vocab**property** oov_character**property** start_character**to_dict()** → dict

Get the configuration object as a dictionary

property vocabulary

```
class aisquared.config.preprocessing.text.Steps.PadSequences(pad_character: int = 0, length: int =
    128, pad_location: str = 'post',
    truncate_location: str = 'post')
```

Bases: *BaseObject*

Text preprocessing object to pad sequences

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.text.PadSequences()
)
```

property length**property** pad_character**property** pad_location**to_dict()** → dict

Get the configuration object as a dictionary

property truncate_location

```
class aisquared.config.preprocessing.text.Steps.RemoveCharacters(remove_digits: bool = True,
    remove_punctuation: bool =
    True)
```

Bases: *BaseObject*

Preprocessing step to remove characters from text

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.text.RemoveCharacters()
)
```

property remove_digits

property remove_punctuation

to_dict() → dict

Get the configuration object as a dictionary

```
class aisquared.config.preprocessing.text.Steps.Tokenize(split_sentences: bool = False,  
                                                    split_words: bool = True, token_pattern:  
                                                    str = '\x08\\w\\w+\x08')
```

Bases: *BaseObject*

Preprocessing Step to tokenize text

Example usage:

```
>>> import aisquared  
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()  
>>> preprocessor.add_step(  
    aisquared.config.preprocessing.text.Tokenize()  
)
```

property split_sentences

property split_words

to_dict() → dict

Get the configuration object as a dictionary

property token_pattern

```
class aisquared.config.preprocessing.text.Steps.Trim
```

Bases: *BaseObject*

Text preprocessing class to trim whitespace from text

Example usage:

```
>>> import aisquared  
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()  
>>> preprocessor.add_step(  
    aisquared.config.preprocessing.text.Trim()  
)
```

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.preprocessing.text.TextPreprocessing module

```
class aisquared.config.preprocessing.text.TextPreprocessing.TextPreprocessor(steps: list |  
                                                                           None = None)
```

Bases: *BaseObject*

Preprocessor object for natural language

Example usage:

```
>>> import aisquared
>>> preprocessor = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocessor.add_step(
    aisquared.config.preprocessing.text.Tokenize()
)
```

add_step(*step*)

Add a step to the preprocessor object

property step_dict

to_dict() → dict

Get the configuration object as a dictionary

Module contents

The `aisquared.config.preprocessing.text` subpackage contains objects for preprocessing text data.

Module contents

The `aisquared.config.preprocessing` subpackage contains utilities to configure the preprocessing of data in the data pipeline. It contains

three separate subpackages, `aisquared.config.preprocessing.text`, `aisquared.config.preprocessing.image`, and `aisquared.config.preprocessing.tabular`, which configure the preprocessing of different types of data.

aisquared.config.rendering package

Submodules

aisquared.config.rendering.BarChartRendering module

```
class aisquared.config.rendering.BarChartRendering.BarChartRendering(label: str, id: str,
    chart_name: str,
    container_id: str,
    prediction_name_key: str,
    prediction_value_key: str,
    prediction_name_value:
    str, display_legend: bool,
    legend_icon: str,
    labels_key: str | None =
    None, width: str = 'auto',
    height: str = 'auto',
    xOffset: str = '0', yOffset:
    str = '0', labels: list | None
    = None,
    consolidate_rows: bool =
    True, css_params: dict |
    None = None)
```

Bases: `BaseObject`

Rendering class for rendering a Bar Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.BarChartRendering(
    'my_label',
    'my_id',
    'my_bar_chart',
    'my_container_id',
    'name',
    'value',
    'name_value',
    True,
    'circle'
)
>>> my_obj.to_dict()
{'className': 'BarChartRendering',
 'label': 'my_label',
 'params': {'id': 'my_id',
 'chartName': 'my_bar_chart',
 'containerId': 'my_container_id',
 'displayLegend': True,
 'legendIcon': 'circle',
 'width': 'auto',
 'height': 'auto',

 'yOffset': '0',
 'datasource': [{'labels': None,
 'labelsKey': None,
 'consolidateRows': True,
 'predictionNameKey': 'name',
 'predictionValueKey': 'value',
 'predictionNameValue': 'name_value'}]}}
```

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.rendering.ChatRendering module

```
class aisquared.config.rendering.ChatRendering.ChatRendering(return_key,
                                                             prediction_value_key=None,
                                                             sender_name='You',
                                                             responder_name='Chatbot')
```

Bases: *BaseObject*

Rendering for a chatbot use case

property prediction_value_key

property responder_name

property return_key

property `sender_name`

property `to_dict()`

Get the configuration object as a dictionary

aisquared.config.rendering.ContainerRendering module

```
class aisquared.config.rendering.ContainerRendering.ContainerRendering(label: str, id: str,  
query_selector: str,  
position: str =  
'absolute',  
static_position: str |  
None = None, width: str = 'auto', height: str = 'auto', display: str =  
'flex', xOffset: str = '0', yOffset: str = '0',  
orientation: str =  
'column', css_params: dict | None = None)
```

Bases: *BaseObject*

Rendering for a container

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.ContainerRendering(
    'my container',
    'myContainerID',
    "[data-id='tabpanel-general']"
)
>>> my_obj.to_dict()
{'className': 'ContainerRendering',
 'label': 'my container',

    dict | None = None)

```

Bases: [BaseObject](#)

Rendering class for rendering a Line Chart

Example usage:

```

>>> import aisquared
>>> my_obj = aisquared.config.rendering.LineChartRendering(
    'my_label',
    'my_id',
    'my_line_chart',
    'my_container_id',
    'name',
    'value',
    'name_value',
    True,
    'circle',
    'labels'
)
>>> my_obj.to_dict()

```

(continues on next page)

(continued from previous page)

```
{'className': 'LineChartRendering',
 'label': 'my_label',
 'params': {'id': 'my_id',
 'chartName': 'my_line_chart',
 'containerId': 'my_container_id',
 'displayLegend': True,
 'legendIcon': 'circle',
 'width': 'auto',
 'height': 'auto',
 'xOffset': '0',
 'yOffset': '0',
 'datasource': [{'labels': None,
 'labelsKey': 'labels',
 'consolidateRows': True,
 'predictionNameKey': 'name',
 'predictionValueKey': 'value',
 'predictionNameValue': 'name_value'}]}}
```

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.rendering.ObjectRendering module

```
class aisquared.config.rendering.ObjectRendering.ObjectRendering(color: str = 'blue', thickness:
    str = '5', placement: str =
    'bottomleft',
    include_probability: bool =
    False, badge_color: str =
    'white', font_color: str = 'black',
    font_size: str = '5')
```

Bases: *BaseObject*

Object which dictates how to render object detection in images

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.ObjectRendering()
>>> my_obj.to_dict()
{'className': 'ObjectRendering',
 'params': {'color': 'blue',
 'thickness': '5',
 'placement': 'bottomleft',
 'includeProbability': False,
 'badgeColor': 'white',
 'fontColor': 'black',
 'fontSize': '5'}}
```

property badge_color

property color

property font_color

property font_size

property include_probability

property placement

property thickness

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.rendering.PieChartRendering module

```

class aisquared.config.rendering.PieChartRendering(label: str, id: str,
                                                    chart_name: str,
                                                    container_id: str,
                                                    prediction_name_key: str,
                                                    prediction_value_key: str,
                                                    prediction_name_value:
                                                    str, display_legend: bool,
                                                    legend_icon: str,
                                                    labels_key: str | None =
                                                    None, width: str = 'auto',
                                                    height: str = 'auto',
                                                    xOffset: str = '0', yOffset:
                                                    str = '0', labels: list | None
                                                    = None,
                                                    consolidate_rows: bool =
                                                    True, css_params: dict |
                                                    None = None)

```

Bases: *BaseObject*

Rendering class for rendering a Pie Chart

Example usage:

```

>>> import aisquared
>>> my_obj = aisquared.config.rendering.PieChartRendering(
    'my_label',
    'my_id',
    'my_doughnut_chart',
    'my_container_id',
    'name',
    'value',
    'name_value',
    True,
    'circle'
)
>>> my_obj.to_dict()
{'className': 'PieChartRendering',
 'label': 'my_label',
 'params': {'id': 'my_id',

```

(continues on next page)

(continued from previous page)

```
'chartName': 'my_doughnut_chart',
'containerId': 'my_container_id',
'displayLegend': True,
'legendIcon': 'circle',
'width': 'auto',
'height': 'auto',
'xOffset': '0',
'yOffset': '0',
'datasource': [{'labels': None,
                  'labelsKey': None,
                  'consolidateRows': True,
                  'predictionNameKey': 'name',
                  'predictionValueKey': 'value',
                  'predictionNameValue': 'name_value'}]}}
```

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.rendering.SOSRendering module

class aisquared.config.rendering.SOSRendering.SOSRendering(*can_toggle: bool, label: str = ""*)

Bases: *BaseObject*

Rendering of an SOS dashboard

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.SOSRendering(True)
>>> my_obj.to_dict()
{'className': 'SOSRendering', 'label': '', 'params': {'canToggle': True}}
```

property can_toggle

property label

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.rendering.TableRendering module

class aisquared.config.rendering.TableRendering.TableRendering(*label: str, id: str, container_id: str, prediction_name_key: str, prediction_value_key: str, prediction_name_values: str, table_name: str = "", css_params: dict | None = None*)

Bases: *BaseObject*

Class for rendering tables

Example usage:

```

>>> import aisquared
>>> my_obj = aisquared.config.rendering.TableRendering(
    'my table',
    'MyTableID',
    'MyContainerID',
    'name_key',
    'value_key',
    'name_values'
)
>>> my_obj.to_dict()
{'className': 'TableRendering',
 'label': 'my table',
 'params': {'id': 'MyTableID',
            'containerId': 'MyContainerID',
            'predictionNameKey': 'name_key',
            'predictionValueKey': 'value_key',
            'predictionNameValues': 'name_values',
            'tableName': ''}}

```

to_dict() → dict

Get the configuration object as a dictionary

aisquared.config.rendering.TextRendering module

class aisquared.config.rendering.TextRendering.**TextRendering**(*prediction_value_key: str | None = None*)

Bases: *BaseObject*

Class for rendering text

Example usage:

```

>>> import aisquared
>>> my_obj = aisquared.config.rendering.TextRendering(
    prediction_value_key = 'my_key'
)
>>> my_obj.to_dict()
{'className': 'TextRendering',
 'params': {'predictionValueKey': 'my_key'}}

```

property prediction_value_key

to_dict()

Get the object as a dictionary

aisquared.config.rendering.WordRendering module

```
class aisquared.config.rendering.WordRendering.WordRendering(word_list: str = 'input', result_key: str | None = None, content_key: str | None = None, badge_shape: str = 'star', badge_color: str = 'blue', classes: list | None = None, threshold_key: str | None = None, threshold_value: int | float | None = None, position: str = 'after')
```

Bases: *BaseObject*

Object for rendering badges on individual words

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.WordRendering()
>>> my_obj.to_dict()
{'className': 'WordRendering',
 'params': {'wordList': 'input',
 'resultKey': None,
 'contentKey': None,
 'badgeShape': 'star',
 'badgeColor': 'blue',
 'classes': None,
 'thresholdKey': None,
 'thresholdValue': None,
 'position': 'after'}}
```

property badge_color

property badge_shape

property classes

property content_key

property position

property result_key

property threshold_key

property threshold_value

to_dict() → dict

Get the configuration object as a dictionary

property word_list

aisquared.config.rendering.utils module

aisquared.config.rendering.utils.**save_default_css()**

Save default CSS so that default CSS can be edited and automatically utilized with changes

Notes

- Saves all CSS files to the `~/aisquared/` directory

Module contents

The aisquared.config.rendering subpackage contains objects for configuring how rendering of predictions is to occur.

Submodules

aisquared.config.CustomObject module

class aisquared.config.CustomObject.**CustomObject**(*class_name: str, top_level_kwargs: dict | None = None, **kwargs*)

Bases: [BaseObject](#)

Custom class that allows the user to define custom classes for configuration

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.base.CustomObject(
    'MyClass',
    key1 = 'foo',
    key2 = 'bar'
)
>>> my_obj.to_dict()
{'className': 'MyClass', 'params': {'key1': 'foo', 'key2': 'bar'}}
```

to_dict() → dict

Get the object as a dictionary

aisquared.config.GraphConfiguration module

class aisquared.config.GraphConfiguration.**GraphConfiguration**(*name: str, stage: str = 'experimental', version: int | None = None, description: str = "", mlflow_uri: str | None = None, mlflow_user: str | None = None, mlflow_token: str | None = None, owner: str | None = None, url: str = '*', auto_run: bool = False, documentation_link: str = ""*)

Bases: *BaseObject*

Configuration object for deploying a set of processing steps and/or analytics as a dependency graph

add_node(*step*: *BaseObject*, *dependencies*: *int* | *list* | *None* = *None*) → *int*

Add a node to the configuration graph

Parameters

- **step** (*aisquared configuration step*) – The step to add
- **dependencies** (*int, list of int, or None*) – The ids of nodes which must be run before the added node

Returns

node_id – The integer id of the node that is added

Return type

int

property auto_run

compile(*filename*: *str* | *None* = *None*, *dtype*: *str* | *None* = *None*) → *None*

Compile the object into a ‘.air’ file, which can then be dragged and dropped into applications using the AI Squared JavaScript SDK

Parameters

- **filename** (*path-like or None (default None)*) – Filename to compile to. If *None*, defaults to ‘{NAME}.air’, where {NAME} is the name of the analytic
- **dtype** (*str or None (default None)*) – The datatype to use for the model weights when using a Keras model. If *None*, defaults to ‘float32’

property description

property documentation_link

get_filenames() → *list*

Get filenames for all models in the configuration

property mlflow_token

property mlflow_uri

property mlflow_user

property name

property owner

property stage

to_dict() → *dict*

Get the object as a dictionary

property url

property version

aisquared.config.ModelConfiguration module

```
class aisquared.config.ModelConfiguration.ModelConfiguration(name: str, harvesting_steps:
    BaseObject | list | None = None,
    preprocessing_steps: BaseObject |
    list | None = None, analytic:
    BaseObject | list | None = None,
    postprocessing_steps: BaseObject |
    list | None = None, rendering_steps:
    BaseObject | list | None = None,
    feedback_steps: BaseObject | list |
    None = None, stage: str =
    'experimental', version: int | None =
    None, description: str = "",
    mlflow_uri: str | None = None,
    mlflow_user: str | None = None,
    mlflow_token: str | None = None,
    owner: str | None = None, url: str =
    '*', auto_run: bool = False,
    documentation_link: str = "",
    warnings: list | None = None)
```

Bases: *BaseObject*

Configuration object for deploying a model or analytic

property analytic

property analytic_dict

property auto_run

compile(filename: str | None = None, dtype: str | None = None) → None

Compile the object into a '.air' file, which can then be dragged and dropped into applications using the AI Squared JavaScript SDK

Parameters

- **filename** (*path-like or None (default None)*) – Filename to compile to. If None, defaults to '{NAME}.air', where {NAME} is the name of the analytic
- **dtype** (*str or None (default None)*) – The datatype to use for the model weights. If None, defaults to 'float32'

property description

property documentation_link

property feedback_dict

property feedback_steps

get_model_filenames() → list

Get filenames for all models in the configuration

property harvester_dict

property harvesting_steps

```
property mlflow_token
property mlflow_uri
property mlflow_user
property name
property owner
property postprocessor_dict
property postprocessing_steps
property preprocessor_dict
property preprocessing_steps
property render_dict
property rendering_steps
property stage
to_dict() → dict
    Get the object as a dictionary
property url
property version
property warnings
```

Module contents

The `aisquared.config` subpackage contains utilities and objects for packaging aisquared configuration steps and models. For in-depth examples of how to build out `.air` files using the utilities and classes in this library, please visit our GitHub repository at <https://github.com/AISquaredInc/airFiles>

aisquared.logging package

Module contents

The `aisquared.logging` subpackage contains utilities for performing experiments within aisquared. This functionality is inherited from MLFlow. Please see the MLFlow documentation at <https://mlflow.org>.

aisquared.platform package

Submodules

aisquared.platform.AISquaredAPIException module

exception aisquared.platform.AISquaredAPIException.**AISquaredAPIException**

Bases: Exception

aisquared.platform.AISquaredPlatformClient module

class aisquared.platform.AISquaredPlatformClient.**AISquaredPlatformClient**(*use_port: bool = False*)

Bases: object

Client for interacting with the AI Squared platform programmatically

When using the client for the first time, it is important to run the *client.login()* method. When doing so, the client will ask for any required information interactively.

```

>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> # If you have never logged in before, run the following code:
>>> client.login()
>>> # Test connection
>>> client.test_connection()
True

```

add_users_to_group(*group_id: str, user_ids: list, port: int = 8086, use_port: bool | None = None*) → bool

Add users to a group

```

>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.add_users_to_group('group_id', ['user_id_1', 'user_id_2'])
True

```

Parameters

- **group_id** (*str*) – The group to add the users to
- **user_ids** (*list of str*) – The IDs of the users to add
- **port** (*int (default 8086)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Returns True if operation was successful

Return type

bool

property base_url: str

The base URL associated with the client

create_group(*display_name: str, role_id: str, port: int = 8086, use_port: bool | None = None*) → dict

Create a group in the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.create_group(
    'group display name',
    'role_id'
)
*dictionary containing group information*
```

Parameters

- **display_name** (*str*) – The display name of the group
- **role_id** (*str*) – The role ID for the group
- **port** (*int (default 8086)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

group_info – Metadata about the created group

Return type

dict

create_user(*user_name: str, given_name: str, family_name: str, email: str, role_id: str, active: bool = True, middle_name: str | None = None, company_id: str | None = None, password: str | None = None, port: int = 8085, use_port: bool | None = None*) → dict

Create a user within the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.create_user(
    'user name',
    'given_name',
    'family_name',
    'user_email',
    'role_id'
)
*Dictionary with user information*
```

Parameters

- **user_name** (*str*) – The display name of the user
- **given_name** (*str*) – The user's first name
- **family_name** (*str*) – The user's last name
- **email** (*str*) – The user's email
- **role_id** (*str*) – The ID of the role to be given to the user

- **active** (*bool* (default *True*)) – Whether the user is active
- **middle_name** (*str* or *None* (default *None*)) – The user's middle name
- **company_id** (*str* or *None* (default *None*)) – The user's company ID
- **password** (*str* or *None* (default *None*)) – The user's password
- **port** (*int* (default *8085*)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

user_data – Metadata about the user

Return type

dict

delete_group(*group_id*, *port*=8086, *use_port*: *bool* | *None* = *None*) → bool

Delete a group from the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_group('group_id')
True
```

Parameters

- **group_id** (*str*) – The ID of the group to delete
- **port** (*int* (default *8086*)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

result – Returns True if successful

Return type

bool

delete_model(*id*: *str*, *port*: *int* = 8080, *use_port*: *bool* | *None* = *None*) → bool

Delete a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_model('model_id')
True
```

Parameters

- **id** (*str*) – The ID for the model
- **port** (*int* (default *8080*)) – The API port for the model. This can be handled automatically by the platform ALB

- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Whether the action was successful

Return type

bool

delete_user(*user_id: str, port: int = 8085, use_port: bool | None = None*) → bool

Delete a user from the system

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_user('user_id')
True
```

Parameters

- **user_id** (*str*) – The user's ID
- **port** (*int (default 8085)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

result – Returns True if the call is successful

Return type

bool

get_group(*group_id: str, port: int = 8086, use_port: bool | None = None*) → dict

Retrieve information about a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_group('group_id')
*dictionary containing group data*
```

Parameters

- **group_id** (*str*) – The ID of the group requested
- **port** (*int (default 8086)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

group_info – The information about the group

Return type

dict

get_group_id_by_name(*group_name: str, port: int = 8083, use_port: bool | None = None*) → str

Get the ID of a group by searching for its display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_group_id_by_name('Group Name')
*group_id*
```

Parameters

- **group_name** (*str*) – The display name of the group
- **port** (*int (default 8083)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

group_id – The ID of the group

Return type

str

get_model(*id: str, port: int = 8080, use_port: bool | None = None*) → dict

Retrieve a model configuration

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model('model_id')
*JSON Response including model data and metadata*
```

Parameters

- **id** (*str*) – The ID for the model
- **port** (*int (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

model – Metadata about the model coupled with the model's configuration information

Return type

dictionary

get_model_id_by_name(*model_name: str, port: int = 8080, use_port: bool | None = None*) → str

Retrieve a model's ID using the name of the model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model_id_by_name('my_awesome_model')
*model_id*
```

Parameters

- **model_name** (*str*) – The name of the model
- **port** (*int* (*default* 8080)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (*default* *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

model_id – The model's ID

Return type

str

get_role_id_by_role_name(*role_name: str, port: int = 8086, use_port: bool | None = None*) → *str*

Get the ID of a role by searching for its display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_role_id_by_role_name('Role Name')
*role_id*
```

Parameters

- **role_name** (*str*) – The name of the role
- **port** (*int* (*default* 8086)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (*default* *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

role_id – The ID of the role

Return type

str

get_user(*user_id: str, port: int = 8085, use_port: bool | None = None*) → *dict*

Retrieve a user's information from the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user('user_id')
*dictionary with results*
```

Parameters

- **user_id** (*str*) – The ID of the user
- **port** (*int* (*default* 8085)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (*default* *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

user_info – The information about the user

Return type

dict

get_user_id_by_name(*name: str, port: int = 8080, use_port: bool | None = None*) → str

Get a user's ID from their display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user_id_by_name('User Name')
*user_id*
```

Parameters

- **name** (*str*) – The display name of the user
- **port** (*int (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns**id** – The ID of the user**Return type**

str

property headers

Headers used for authentication with the AI Squared Platform

list_group_users(*group_id: str, as_df: bool = True, port: int = 8083, use_port: bool | None = None*) → DataFrame | dict

List users in a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_group_users('group_id')
*DataFrame with results*
```

Parameters

- **group_id** (*str*) – The ID for the group
- **as_df** (*bool (default True)*) – Whether to return the response as a pandas DataFrame
- **port** (*int (default 8083)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns**users** – The response from the API**Return type**

pandas DataFrame or dictionary

list_groups(*max_count: int = 100, as_df: bool = True, port: int = 8083, use_port: bool | None = None*) → DataFrame | dict

List all groups

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_groups()
*DataFrame with results*
```

Parameters

- **max_count** (*int (default 100)*) – The maximum number of groups to return
- **as_df** (*bool (default True)*) – Whether to return the result as a pandas DataFrame
- **port** (*int (default 8083)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

groups – The response from the API

Return type

pandas DataFrame or dictionary

list_model_feedback(*model_id: str, limit: int = 10, as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → dict | DataFrame

List feedback on a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_feedback('model_id')
*DataFrame with Results*
```

Parameters

- **model_id** (*str*) – The ID of the model
- **limit** (*int (default 10)*) – The maximum number of feedback items to return
- **port** (*int (default 8080)*) – The API port to use. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

feedback – The feedback

Return type

dict or pandas DataFrame

list_model_prediction_feedback(*model_id: str, as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → dict | DataFrame

List all feedback for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_prediction_feedback('model_id')
*DataFrame with Results*
```

Parameters

- **model_id** (*str*) – The ID of the model requested
- **as_df** (*bool* (default *True*)) – Whether to return the results as a pandas DataFrame
- **port** (*int* (default *8080*)) – The API port to use. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

results – The results from the platform

Return type

dict or pandas DataFrame

list_model_usage_metrics(*model_id: str, period: str = 'hourly', as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → dict | DataFrame

Get usage metrics for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model_usage_metrics('model_id')
*DataFrame with results*
```

Parameters

- **model_id** (*str*) – The ID of the model
- **period** (*str* (default *'hourly'*)) – The period to group metrics into
- **as_df** (*bool* (default *True*)) – Whether to return results as a pandas DataFrame
- **port** (*int* (default *8080*)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

results – The results from the platform

Return type

pandas DataFrame or dict

list_model_users(*id: str, as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → DataFrame | dict

List users for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_users('model_id')
*DataFrame with results*
```

Parameters

- **id** (*str*) – The ID for the model
- **as_df** (*bool* (default *True*)) – Whether to return the response as a Pandas DataFrame
- **port** (*int* (default *8080*)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

model_users – The users for the model

Return type

pandas DataFrame or dictionary

list_models(*as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → DataFrame | dict
List models within the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_models()
*DataFrame with results*
```

Parameters

- **as_df** (*bool* (default *True*)) – Whether to return the response as a pandas DataFrame
- **port** (default *None*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

models – The models

Return type

pandas DataFrame or dictionary

list_prediction_feedback(*prediction_id: str, as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → DataFrame | dict

List prediction feedback given a prediction ID

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_prediction_feedback('prediction_id')
*DataFrame with results*
```

Parameters

- **prediction_id** (*str*) – The prediction ID
- **as_df** (*bool* (default *True*)) – Whether to return the results as a pandas DataFrame
- **port** (*int* (default *8080*)) – The API port to use. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

results – The results from the platform

Return type

pandas DataFrame or dict

list_roles(*as_df: bool = True, port: int = 8086, use_port: bool | None = None*) → DataFrame | dict

List the roles available in the platform

Example usage:

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_roles()
*DataFrame with results*
```

Parameters

- **as_df** (*bool* (default *True*)) – Whether to return the results as a pandas DataFrame
- **port** (*int* (default *8086*)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (default *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

roles – The roles

Return type

pandas DataFrame or dict

list_user_usage_metrics(*user_id: str, period: str = 'hourly', as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → dict | DataFrame

Get usage metrics for a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user_usage_metrics('user_id')
*DataFrame with results*
```

Parameters

- **user_id** (*str*) – The ID of the user
- **period** (*str* (default *'hourly'*)) – The period to group metrics into
- **as_df** (*bool* (default *True*)) – Whether to return results as a pandas DataFrame

- **port** (*int (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

results – The results from the platform

Return type

pandas DataFrame or dict

list_users(*max_count: int = 100, as_df: bool = True, port: int = 8080, use_port: bool | None = None*) → DataFrame | dict

List all users

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_users()
*DataFrame with results*
```

Parameters

- **max_count** (*int (default 100)*) – The maximum number of users to return
- **as_df** (*bool (default True)*) – Whether to return the data as a Pandas DataFrame
- **port** (*int (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

users – The response from the API

Return type

pandas DataFrame or dictionary

login(*url: str | None = None, port: int = 8080, username: str | None = None, password: str | None = None, use_port: bool | None = None*) → None

Log in to the platform programmatically. If no url, username, or password are provided, logs in interactively

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.login()
Enter URL: https://platform.squared.ai
Enter Username: your.email@your_domain.com
Enter Password: <hidden>
```

Parameters

- **url** (*str or None (default None)*) – The URL for the platform API
- **port** (*int or None (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **username** (*str or None (default None)*) – The username

- **password** (*str or None (default None)*) – The password
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

property password: `str`

The password associated with the client

remove_users_from_group (*group_id: str, user_ids: list, port: int = 8086, use_port: bool | None = None*)
→ `bool`

Remove users from a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.remove_users_from_group('group_id', ['user_id_1', 'user_id_2'])
True
```

Parameters

- **group_id** (*str*) – The ID of the group
- **user_ids** (*list of str*) – The IDs of the users to remove
- **port** (*int (default = 8086)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Returns True if successful

Return type

`bool`

share_model_with_group (*model_id: str, group_id: str, port: int = 8080, use_port: bool | None = None*)
→ `bool`

Share a model with a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.share_model_with_group('model_id', 'group_id')
True
```

Parameters

- **model_id** (*str*) – The ID for the model to be shared
- **group_id** (*str*) – The ID for the group to be shared with. This can be handled automatically by the platform ALB
- **port** (*int (default 8080)*) – The API port to use. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Returns True if successful

Return type

bool

share_model_with_user(*model_id: str, user_id: str, port: int = 8080, use_port: bool | None = None*) → bool

Share a model with a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.share_model_with_user('model_id', 'user_id')
True
```

Parameters

- **model_id** (*str*) – The ID for the model
- **user_id** (*str*) – The ID for the user
- **port** (*int (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Whether the action was successful

Return type

bool

test_connection(*port: int = 8080, use_port: bool | None = None*) → bool

Test whether there is a healthy connection to the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.test_connection()
True
```

Parameters

- **port** (*int (default 8080)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – True if connection was successful

Return type

bool

property token: **str**

The token associated with the client

unshare_model_with_group(*model_id: str, group_id: str, port: int = 8080, use_port: bool | None = None*) → bool

Unshare a model with a group

```
>>> import aisquared
>>> client = aisquared.client.AISquaredPlatformClient()
>>> client.unshare_model_with_group('model_id', 'group_id')
True
```

Parameters

- **model_id** (*str*) – The ID of the model
- **group_id** (*str*) – The ID of the group
- **port** (*int* (*default* 8080)) – The API port to use. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (*default* *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

success – Returns True if successful

Return type

bool

unshare_model_with_user(*model_id: str, user_id: str, port: int = 8080, use_port: bool | None = None*) → bool

Unshare a model with a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.unshare_model_with_user('model_id', 'user_id')
True
```

Parameters

- **model_id** (*str*) – The ID for the model
- **user_id** (*str*) – The ID for the user
- **port** (*int* (*default* 8080)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (*default* *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

success – Whether the action was successful

Return type

bool

update_group(*group_id: str, display_name: str, role_id: str, port: int = 8086, use_port: bool | None = None*) → bool

Update information about a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.update_group(
```

(continues on next page)

(continued from previous page)

```

    'group_id',
    'group display name',
    'role_id'
)
True

```

Parameters

- **group_id** (*str*) – The ID of the group to update
- **display_name** (*str*) – The display name of the group
- **role_id** (*str*) – The ID of the role for the group
- **port** (*int* (*default* 8086)) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool* or *None* (*default* *None*)) – Whether to use port in URL formatting. If *None*, defaults to class value

Returns

success – Returns True if successful

Return type

bool

update_user(*user_id: str, user_name: str, given_name: str, family_name: str, email: str, role_id: str, active: bool = True, middle_name: str | None = None, company_id: str | None = None, password: str | None = None, port: int = 8085, use_port: bool | None = None*) → bool

Update information about a user

```

>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.update_user(
    'user_id',
    'user name',
    'given_name',
    'family_name',
    'user_email',
    'role_id'
)
True

```

Parameters

- **user_id** (*str*) – The ID of the user to update
- **user_name** (*str*) – The display name of the user
- **given_name** (*str*) – The first name of the user
- **family_name** (*str*) – The last name of the user
- **email** (*str*) – The user's email
- **role_id** (*str*) – The ID of the user's role
- **active** (*bool* (*default* *True*)) – Whether the user is active

- **middle_name** (*str or None (default None)*) – The user’s middle name
- **company_id** (*str or None (default None)*) – The user’s company ID
- **password** (*str or None (default None)*) – The user’s password
- **port** (*int (default 8085)*) – The API port for the call. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Returns True if update is successful

Return type

bool

upload_model (*model_file: str, port: int = 8081, use_port: bool | None = None*) → str

Upload a model to the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.upload_model('my_model_filename.air')
True
```

Parameters

- **model_file** (*path or path-like*) – The path to the model file
- **port** (*int (default 8081)*) – The API port to use. This can be handled automatically by the platform ALB
- **use_port** (*bool or None (default None)*) – Whether to use port in URL formatting. If None, defaults to class value

Returns

successful – Whether the action was successful

Return type

bool

property use_port

property username: str

The username associated with the client

aisquared.platform.DatabricksAPIException module

exception aisquared.platform.DatabricksAPIException.DatabricksAPIException

Bases: Exception

aisquared.platform.DatabricksClient module**class** aisquared.platform.DatabricksClient.DatabricksClient

Bases: object

Client for working with a connected Databricks environment

When using the client for the first time, it is important to authenticate the client using the `client.login()` method. When doing so, the client will ask for any required information interactively.

```
>>> import aisquared
>>> client = aisquared.platform.DatabricksClient()
>>> # If you have never logged in before, run the following code:
>>> client.login()
>>> # Interactive session requesting required information
```

property base_url: str

The base URL for the workspace

create_compute(compute_name: str, spark_version: str, node_type_id: str) → dict

Create a compute resource

Parameters

- **compute_name** (str) – The name of the compute to create
- **spark_version** (str) – The spark version to use for the compute resource
- **node_type_id** (str) – The node type ID to use

Returns**compute_info** – The information about the created compute resource**Return type**

dict

create_job(job_name: str, tasks: list, libraries: list, compute_name: str, spark_version: str, node_type_id: str, cron_syntax: str | None = None, timezone: str | None = None) → bool

Create a job using notebooks and/or scripts in the workspace

Parameters

- **job_name** (str) – The name for the job
- **tasks** (list of dict) – List of {task_name : task_script} dictionary pairs to run in the job
- **libraries** (list of str) – The dependent libraries to install on all compute
- **compute_name** (str) – The name of the compute to provision specifically for this job
- **spark_version** (str) – The version of Spark to use on the compute instances
- **node_type_id** (str) – The node type to use
- **cron_syntax** (str or None (default None)) – If the job is to be set to a schedule, the cron syntax for that schedule
- **timezone** (str or None (default None)) – The timezone to set the schedule to, if cron syntax is provided

Returns**success** – Whether the create job call was successful

Return type

bool

create_served_model(*model_name: str, model_version: str, workload_size: str, scale_to_zero_enabled: bool = True, workload_type: str = 'CPU'*) → dict

Create a model serving endpoint

Parameters

- **model_name** (*str*) – The name of the model to serve
- **model_version** (*str*) – The version of the model to serve
- **workload_size** (*str*) – The workload size of the serving endpoint
- **scale_to_zero_enabled** (*bool* (*default True*)) – Whether to allow for scaling the endpoint to zero
- **type** (*workload*) – The workload type - either 'CPU' or 'GPU'

Returns

configuration – Configuration information about the serving endpoint

Return type

dict

delete_compute(*compute_id: str*) → bool

Delete a compute resource in the workspace

Parameters

compute_id (*str*) – The ID for the compute to delete

Returns

success – Whether the operation was successful

Return type

bool

delete_from_workspace(*filename: str*) → bool

Delete a file from the workspace

Parameters

filename (*str*) – The name of the file to delete

Returns

success – Whether the operation is successful

Return type

bool

delete_job(*job_id: str*) → bool

Delete a job from the workspace

Parameters

job_id (*str*) – The ID of the job to delete

Returns

success – Whether the delete operation was successful

Return type

bool

delete_registered_model(*model_name: str*) → bool

Delete a registered model

Parameters

model_name (*str*) – The name of the model to delete

Returns

success – Whether the delete operation was successful

Return type

bool

delete_served_model(*model_name: str*) → bool

Delete a served model in the workspace

Parameters

model_name (*str*) – The name of the model to delete

Returns

success – Whether the delete operation was successful

Return type

bool

download_from_workspace(*filename: str*) → str

Download a file from the workspace

Parameters

filename (*str*) – The filename of the file to download

Returns

contents – The contents of the file

Return type

str

property headers: dict

API headers for calls to the API

list_compute(*as_df: bool = True*) → dict | DataFrame

List compute in the workspace

Parameters

as_df (*bool (default True)*) – Whether to return a pandas DataFrame

Returns

compute – The compute resources in the workspace

Return type

dict or pd.DataFrame

list_jobs(*as_df: bool = True*) → dict | DataFrame

List all jobs in the workspace

Parameters

as_df (*bool (default True)*) – Whether to return a pandas DataFrame

Returns

jobs – The jobs that exist in the workspace

Return type

dict or pandas DataFrame

list_registered_models(*as_df: bool = True*) → dict | DataFrame

List registered models in the workspace

Parameters

as_df (*bool (default True)*) – Whether to return a pandas DataFrame

Returns

models – The models in the workspace

Return type

dict or pandas DataFrame

list_served_models(*as_df: bool = True*) → dict | DataFrame

List served models in the workspace

Parameters

as_df (*bool (default True)*) – Whether to return results as a pandas DataFrame

Returns

models – The models served in the workspace

Return type

dict or pandas DataFrame

list_workspace(*as_df: bool = True*) → DataFrame | dict

List files in the connected Databricks workspace

Parameters

as_df (*bool (default True)*) – Whether to return the results as a pandas DataFrame

Returns

results – The files in the workspace

Return type

dict or pd.DataFrame

login(*url: str | None = None, username: str | None = None, token: str | None = None, persist: bool = True*) → None

Log in to the Databricks environment programmatically

```
>>> import aisquared
>>> client = aisquared.platform.DatabricksClient()
>>> client.login()
Enter URL: {Databricks_workspace_url}
Enter Username: your.email@your_domain.com
Enter Secret Token: <hidden>
```

Parameters

- **url** (*str or None (default None)*) – The URL of the Databricks workspace
- **username** (*str or None (default None)*) – The username in the Databricks workspace
- **token** (*str or None (default None)*) – The secret token for the Databricks workspace
- **persist** (*bool (default True)*) – Whether to persist the login information, eliminating the need to run this command again in the future

run_job(*job_id: str*) → int

Run a job

Parameters

job_id (*str*) – The ID of the job to run

Returns

run_id – The ID of the specific run that was created

Return type

int

start_compute(*compute_id: str*) → bool

Start a compute resource

Parameters

compute_id (*str*) – The ID of the compute to start

Returns

success – Whether the start operation was successful

Return type

bool

stop_compute(*compute_id: str*) → bool

Stop a compute resource

Parameters

compute_id (*str*) – The ID of the compute to start

Returns

success – Whether the stop operation was successful

Return type

bool

property token: str

The token to use for the workspace

update_job(*job_id: int, job_name: str, tasks: list, libraries: list, compute_name: str, spark_version: str, node_type_id: str, cron_syntax: str | None = None, timezone: str | None = None*) → bool

Update a job by Job ID using notebooks and/or scripts in the workspace

Parameters

- **job_id** (*int*) – The unique identifier of the job to update
- **job_name** (*str*) – The new name for the job
- **tasks** (*list of dict*) – List of {task_name : task_script} dictionary pairs to run in the updated job
- **libraries** (*list of str*) – The dependent libraries to install on all compute for the new job
- **compute_name** (*str*) – The name of the compute to provision specifically for the new job
- **spark_version** (*str*) – The version of Spark to use on the compute instances
- **node_type_id** (*str*) – The node type to use
- **cron_syntax** (*str or None (default None)*) – If the new job is to be set to a schedule, the cron syntax for that schedule

- **timezone** (*str or None (default None)*) – The timezone to set the schedule to, if cron syntax is provided

Returns

success – Whether the update job call was successful

Return type

bool

upload_to_workspace(*filename: str, overwrite: bool = False*) → bool

Upload a file to the workspace

Parameters

- **filename** (*str*) – The name of the file to upload
- **overwrite** (*bool (default False)*) – Whether to overwrite the file if one of the same name already exists in the workspace

Returns

success – Whether the upload was successful

Return type

bool

property username: str

The user's username

aisquared.platform.NoResultsFoundError module

exception aisquared.platform.NoResultsFoundError.NoResultsFoundError

Bases: Exception

aisquared.platform.additional_utils module

aisquared.platform.crudl module

aisquared.platform.feedback module

aisquared.platform.metrics module

aisquared.platform.sharing module

aisquared.platform.user_group module

Module contents

Utilities for interacting with the AI Squared Platform.

The primary class within this subpackage is the *AISquaredPlatformClient* class, which has the capabilities to interact with much of the functionality in the AI Squared platform. For more information about this class, please see its documentation.

aisquared.serving package

Submodules

aisquared.serving.deploy_model module

```
aisquared.serving.deploy_model.deploy_model(saved_model: str, model_type: str, host: str = '127.0.0.1',
                                             port: int = 2244, custom_objects: dict | None = None,
                                             additional_functions_file: str | None = None)
```

Deploy a model to a Flask server on the specified host

Parameters

- **saved_model** (*Path-like*) – The path to the saved model directory or model file
- **model_type** (*str*) – The type of model
- **host** (*str (default '127.0.0.1')*) – The host to deploy to
- **port** (*int (default 2244)*) – The port to deploy to
- **custom_objects** (*dict or None (default None)*) – Any custom objects to load when using a BeyondML model
- **additional_functions_file** (*file-like or None (default None)*) – File name containing additional functions (which have to be named *preprocess* and *postprocess*, if created) that are used during the prediction process

```
aisquared.serving.deploy_model.load_beyondml_model(model: str, custom_objects: dict)
```

Load a BeyondML model with custom objects

aisquared.serving.get_remote_prediction module

```
aisquared.serving.get_remote_prediction.get_remote_prediction(data: dict | str | ndarray | list, host:
                                                              str = '127.0.0.1', port: int = 2244)
→ list
```

Send data to use for prediction

Parameters

- **data** (*dict, str, np.ndarray, or list*) – The data to be predicted on
- **host** (*str (default '127.0.0.1')*) – The host to use
- **port** (*int (default '2244')*) – The port to use

Notes

- If data is a dictionary, it is expected to already be correctly formatted
- If data is a string, it is expected to already be correctly formatted

Returns

predictions – The predictions from the deployed model

Return type

list

Module contents

The `aisquared.serving` package contains utilities to serve models to a local REST endpoint.

Here is an example of how to serve a simple keras model using these utilities:

```
>>> # Assume model is already trained and stored in memory as model
>>> from aisquared import serving
>>> serving.save_keras_model(model, 'my_model')
>>> serving.deploy_model(
    'my_model',
    'keras',
    additional_functions_file = '<optional file containing `preprocess` and
    ↳ `postprocess` functions, if applicable>'
)
App created successfully. Serving and awaiting requests
```

And to retrieve predictions from the model:

```
>>> # From a separate terminal, assume data is already loaded
>>> from aisquared import serving
>>> serving.get_remote_predictions(data) # Do not need to change host or port if
    ↳ predicting from the same machine
*predictions*
```

aisquared.utils package

Submodules

aisquared.utils.utils module

`aisquared.utils.utils.get_model(model_type: str, input_shape: int | tuple, num_outputs: int, output_activation: str, size: str = 'small', vocab_size: None | int = None)`

Get a pre-configured model for different use cases

Parameters

- **model_type** (*str*) – Either 'cv', 'nlp_embedding', or 'fc', defining the model type
- **input_shape** (*int or tuple of int*) – The input shape to the model
- **num_outputs** (*int*) – The output shape of the model
- **output_activation** (*str or keras activation function*) – The activation of the final layer of the model
- **size** (*str (default 'small')*) – One of either 'small', 'medium', or 'large'
- **vocab_size** (*str or None (default None)*) – Size of the vocab, if model_type is 'nlp_embedding'

Returns

model – The model

Return type

TensorFlow Keras model

```
aisquared.utils.utils.mimic_model(trained_model: BaseEstimator, nnet: Model, training_data: ndarray,  
                                  test_data: ndarray, test_labels: ndarray, problem_type: str, loss: str,  
                                  metrics: str | list, optimizer: str, mimic_proba: bool = False, retention:  
                                  float = 0.9, batch_size: int = 32, epochs: int = 100,  
                                  starting_sparsification: int = 0, max_sparsification: int = 99,  
                                  sparsification_rate: int = 5) → Model
```

Train a sparse neural network to mimic a scikit-learn model

Parameters

- **trained_model** (*sklearn model*) – The model that is already trained
- **nnet** (*TensorFlow keras Model*) – The neural network to train to mimic the trained model
- **training_data** (*array or array-like*) – The input data that was used to train the trained model
- **test_data** (*array or array-like*) – The input data to be used for testing
- **test_labels** (*array or array-like*) – The output data used in testing
- **problem_type** (*str*) – The type of problem, either ‘classification’ or ‘regression’
- **loss** (*str or keras loss function*) – The loss to use
- **metrics** (*str, function or list of str, function*) – Metrics to measure
- **optimizer** (*str or keras optimizer*) – The optimizer to use
- **mimic_proba** (*bool (default False)*) – For classification, mimic the probability outputs
- **retention** (*float (default 0.9)*) – The retention of performance to allow further pruning
- **batch_size** (*int (default 32)*) – The batch size to use while training
- **epochs** (*int (default 100)*) – The number of epochs (if early stopping is not met beforehand)
- **starting_sparsification** (*int (default 0)*) – The starting model sparsification
- **max_sparsification** (*int (default 99)*) – The maximum sparsification to allow
- **sparsification_rate** (*int (default 5)*) – The sparsification rate when invoked

Returns

nnet – The trained model

Return type

TensorFlow keras Model

Module contents

Additional utilities to use with the *aisquared* package. These utilities currently consist of two functions, the *mimic_model* and *get_model* functions. They utilize functionality that exists in our open source package BeyondML to train teacher-student models

To see in-depth examples of how to use these functions, please visit our GitHub repository at <https://github.com/AISquaredInc/MimicModelExamples>

1.1.1.2 Module contents

This package contains utilities to interact with the AI Squared technology stack, particularly with developing and deploying models to the AI Squared Browser Extension or other applications developed through the AI Squared JavaScript SDK.

CHANGELOG

- **Version 0.1.3**

- Added *flags* parameter to *TextHarvester* using regular expression harvesting
- Deleted *model_feedback* parameter in *ModelConfiguration* object and included functionality in *feedback_steps* parameter
- Changed *format* parameter to *header* for both deployed analytics
- Added feedback and stages to *DocumentPredictor* and *ImagePredictor* objects
- Non-API changes for *ALLOWED_STAGES*
- Fixed bugs preventing Windows users from importing the package
- Updated *ModelConfiguration* to include *url* parameter
- Changed default tokenization string

- **Version 0.2.0**

- Moved preprocessing steps under subpackages for specific kinds of preprocessing steps
- Cleaned up documentation to render within programmatic access environments
- Added *aisquared.logging* subpackage
- **Created *InputHarvester***
 - * Allows for harvesting of input text, images, and tabular data
- Created the *aisquared.serving* subpackage, specifically the *deploy_model* and *get_remote_prediction* functions
- Created the *GraphConfiguration* class
- Added *auto-run* parameter to *ModelConfiguration* and *GraphConfiguration* classes
- **Created the *aisquared* CLI with the following commands:**
 - * *aisquared deploy*, which deploys a model locally
 - * *aisquared predict*, which predicts using a local JSON file
 - * *aisquared airfiles*, which contains the subcommands *list*, *delete*, *download*, and *upload*
- Changed all classes within *aisquared.config.analytic* to accept ‘*tabular*’ as an *input_type*
- Removed *aisquared.logging* and *aisquared.remote* from top-level imports
- Added *round* parameter to Regression postprocessor
- Removed *DocumentPredictor* and *ImagePredictor* classes

- Removed *ChainRendering* class
- Created *FilterRendering* class
- Altered *QUALIFIERS*
- Added advanced rendering parameters to rendering objects
- Removed *logging* and *remote* subpackages from top-level *aisquared* import

- **Version 0.2.1**

- Added the *S3Connector* class to the *analytics* subpackage, which allows download of an analytic directly from S3
- Updated the documentation and added the *docs* subdirectory for hosting the documentation on GitHub Pages

- **Version 0.2.2**

- Fixed bug in *to_dict* method within *ObjectRendering* class
- Fixed bug in name of *MultiplyValue* step
- Fixed bug in datatype checking for text harvester
- Added *body_only* parameter to *TextHarvester*
- Added ‘underline’ to possible badges
- Added *threshold_key* and *threshold_values* to relevant rendering classes
- Added *Trim* text preprocessing class
- Added *CustomObject* in the base package to allow for creation of custom classes
- Added keyword harvesting capabilities
- Added *utils* subpackage with capabilities to mimic a trained sklearn model
- Small documentation changes
- Changed the required imports for the package to streamline installation process, and created two installation options *aisquared* and *aisquared[full]*

- **Version 0.2.3**

- Added functionality to add custom preprocessing and postprocessing functions to the model deployment pipeline
- Added *all* parameter to *LocalAnalytic* class
- Changed under-the-hood functionality of *mimic_model* function in line with updates to *BeyondML*
- Altered the *ReverseMLWorkflow* analytic
- Added the *BarChartRendering*, *ContainerRendering*, *DashboardReplacementRendering*, *DoughnutChartRendering*, *HTMLTagRendering*, *LineChartRendering*, *PieChartRendering*, *SOSRendering*, and *TableRendering* rendering classes
- Added the *QueryParameterHarvester* harvester class
- Added the *limit* parameter to the *TextHarvester* class

- **Version 0.3.0**

- Added type hinting to documentation strings
- Revamped documentation to use Sphinx

- **Version 0.3.1**
 - Changed Python type hints to allow for backwards compatibility with older versions of Python
- **Version 0.3.2**
 - Added functionality to the *AISquaredPlatformClient*
 - Added *top_level_kwargs* parameter to the *CustomObject* class
 - Added *DashboardRendering* class
 - Removed ‘px’ from default values in *ImageRendering* and *ObjectRendering* classes
 - Added functionality for creating, updating, and deleting users to *AISquaredPlatformClient*
 - Added functionality for creating, updating, and deleting groups to *AISquaredPlatformClient*
 - Fixed bug related to requiring *auto_run* parameter to be string (fix involves casting as string)
 - Altered schemas for different “Chart” Rendering classes to conform to JavaScript standards
 - Streamlined the *ModelConfiguration* class to allow a more functional interface to build *.air* files
 - Updated *ContainerRendering* class with parameters for *position* and *static_position*
 - Updated across-the-board functionality of the *AISquaredPlatformClient*
- **Version 0.3.3**
 - Updated functionality of the *AISquaredPlatformClient* to interact directly with the platform ALB
 - Changed function names in support of change from MANN to BeyondML
 - Added documentation surrounding global configuration objects
 - Removed redundant additional dependencies
- **Version 0.3.4**
 - Added support for custom CSS strings to appropriate rendering classes
 - Refactored *AISquaredPlatformClient* to import functions from support files
 - Fixed documentation errors for the documentation site
 - Checked whether responses returned OK status code rather than 200
 - Moved *CustomObject* to *aisquared.config* from *aisquared.base*
 - Changed endpoint used to list platform users
 - Fixed response behaviors where no data was returned from *AISquaredPlatformClient*
- **Version 0.3.5**
 - Changed *file_name* parameter in *ReverseMLWorkflow* to *file_names*
 - Added *documentation_link* parameter to *ModelConfiguration* class
- **Version 0.3.6**
 - Fixed issue with type checking for *ModelConfiguration* Rendering classes
 - Restricted TensorFlow version to below 2.12.0 to prevent import issues
 - Added *position* parameter to *WordRendering* class
 - Changed default CSS styling for rendering classes
 - Changed name of all *processor* classes to *processer*

- **Version 0.3.7**
 - Changed schema of the *DeployedAnalytic* class to include API key management
 - Changed JSON schema of Preprocessor classes
 - Allowed .keras files to be saved and loaded with the *ModelConfiguration* and *GraphConfiguration* APIs into .air files
 - Relaxed TensorFlow requirements enforced in version 0.3.6
- **Version 0.3.8**
 - Created *ChatbotHarvester* class
 - Created *TextRendering* class
 - Changed location of reference lists of classes to clean up code
 - Updated class schemas to ensure compliance with expectations
 - Updated test cases
- **Version 0.3.9**
 - Created *CustomRendering* class
 - Changed to full import of *CustomObject* in *aisquared.base* subpackage
- **Version 0.3.10**
 - Added *DatabricksClient* to the *aisquared.platform* subpackage
- **Version 0.3.11**
 - Updated *DeployedModel* class configuration to conform to AIRJS
 - Updated *DatabricksClient* class to include *update_job* function
 - Updated custom CSS fields in rendering classes
 - Reconfigured *ReverseMLWorkflow* class
 - Added 'User-Agent' to headers for *AISquaredPlatformClient* and *DatabricksClient*
 - Added *llmlink* as a dependency to the 'full' installation of *aisquared* and added it as a top-level package
- **Version 0.3.12**
 - Updated *DeployedModel* class to support more abstract API calls
 - Updated *ChatbotHarvester*, *DeployedAnalytic*, and *ChatRendering* classes
 - Updated *ModelConfiguration* class with *warnings* and *documentURL*
 - Updated *DeployedAnalytic* class with more general support for API calls, *DeployedModel* to be deprecated
