This package contains utilities to interact with the AI Squared technology stack, particularly with developing and deploying models to the AI Squared Platform or other applications developed through the AI Squared JavaScript SDK.

Current Production Version: 0.3.11

CHAPTER

ONE

INSTALLATION

This package is available through Pypi and can be installed by running the following command:

pip install aisquared

Alternatively, the latest version of the software can be installed directly from GitHub using the following command:

pip install git+https://github.com/AISquaredInc/aisquared

1.1 aisquared

1.1.1 aisquared package

1.1.1.1 Subpackages

aisquared.base package

Submodules

aisquared.base.BaseObject module

class aisquared.base.BaseObject.BaseObject

Bases: object

Base class used for all other classes within the aisquared package. This class is not meant to be used by any end user of this package, but is rather used throughout this package as a parent class.

 $\textbf{to_dict()} \rightarrow dict$

Get the object as a dictionary

 $\textbf{to_json()} \rightarrow str$

Return the object as a json string

aisquared.base.css module

aisquared.base.endpoints module

NOT MEANT TO BE CALLED BY THE END USER - configuration parameters for the different endpoints in the platform

aisquared.base.harvesting module

Some allowed configuration parameters - not designed to be directly called by the user

aisquared.base.platform module

aisquared.base.preprocessing module

Some allowed configuration parameters - not designed to be directly called by the user

aisquared.base.rendering module

Some allowed configuration parameters - not meant to be directly called by the end user

aisquared.base.stages module

Some allowed configuration parameters - not designed to be directly called by the user

Module contents

The aisquared base package contains both some basic objects that are used across the aisquared package backend and some objects which are designed to facilitate simple use cases of the technology.

aisquared.config package

Subpackages

aisquared.config.analytic package

Submodules

aisquared.config.analytic.DeployedAnalytic module

```
Bases: BaseObject
```

Interaction with a remote endpoint.

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.DeployedAnalytic(
    'model_url',
    'POST',
    'text',
    {
        'Content-Type' : 'application/json'
    },
    {
        'data_to_be_sent' : '{{input}}'
    }
>>> analytic.to_dict()
{'className': 'DeployedAnalytic',
'params': {'url': 'model_url',
'method': 'POST',
'inputType': 'text',
'headers': {'Content-Type': 'application/json'},
'body': {'data_to_be_sent': '{{input}}'}}
```

```
property body
property headers
property input_type
property method
to_dict() → dict
    Get the object as a dictionary
property url
```

aisquared.config.analytic.DeployedModel module

Bases: BaseObject

Interaction with a remote model

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.DeployedModel(
    'model_url',
    'text'
)
>>> analytic.to_dict()
{'className': 'DeployedModel',
'params': {'url': 'model_url',
    'inputType': 'text',
    'headers': None,
    'bodyKey': None,
    'returnKey': None,
    'bodySetup?: None,
    'bodySetupReplaceValue': None}}
```

```
property body_key
property body_setup
property body_setup_replace_value
property headers
property input_type
property return_key
to_dict() → dict
Get the config object as a dictionary
property url
```

aisquared.config.analytic.LocalAnalytic module

Bases: BaseObject

Interaction with an analytic (lookup table) saved to the local file system

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.LocalAnalytic(
    'analytic_path',
    'text'
)
>>> analytic.to_dict()
{'className': 'LocalAnalytic',
    'params': {'path': 'analytic_path',
    'inputType': 'text',
    'all': False}}
```

property all

```
property input_type  \label{eq:property} \mbox{path}   \mbox{to\_dict()} \rightarrow \mbox{dict}  Get the configuration object as a dictionary
```

aisquared.config.analytic.LocalModel module

```
class aisquared.config.analytic.LocalModel.LocalModel(path: str, input_type: str)
```

Bases: BaseObject

Interaction with a model currently saved to the local file system

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.LocalModel(
    'model_path',
    'text'
)
>>> analytic.to_dict()
{'className': 'LocalModel',
    'params': {'path': 'model_path',
    'inputType': 'text'}}
```

```
property input_type
```

property path

 $\textbf{to_dict()} \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.analytic.ReverseMLWorkflow module

class aisquared.config.analytic.ReverseMLWorkflow.ReverseMLWorkflow(label: str, connector_type:

```
str, connector_action: str =
'read', input_type: str =
'text', filter_type: str =
'input', file_names: list =
[], bucket: str = ",
filter\_by\_columns: list = [],
all: bool = False, arn: str
= ", host: str = ", path: str
= ", port: str = ", role: str
= ", soql: str = ", query: str
= ", token: str = ", column:
str = ", db name: str = ",
db\_user: str = ", period:
int \mid None = None, schema:
str = ", secret: str = ",
account: str = ", data\_map:
list = [], db\_table: str = ",
client_id: str = ",
file\_name: str = ",
password: str = ",
schedule: str = ",
sync keys: dict =
{'destination': ", 'source':
"}, warehouse: str = ",
data\_source: str = ",
cluster\_name: str = ",
client\_secret: str = ",
organization: str = ",
authentication\_type: str =
")
```

Bases: BaseObject

Creation of a ReverseML Workflow to interact with remote data sources

```
\textbf{to\_dict()} \rightarrow dict
```

Get the configuration object as a dictionary

Module contents

The aisquared.config.analytic subpackage contains objects for packaging individual analytics.

aisquared.config.feedback package

Submodules

aisquared.config.feedback.BinaryFeedback module

```
class aisquared.config.feedback.BinaryFeedback.BinaryFeedback(label_map: list)
```

```
Bases: BaseObject
```

Feedback for binary classification

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.BinaryFeedback(['class1', 'class2'])
>>> my_obj.to_dict()
{'className': 'BinaryFeedback', 'params': {'labelMap': ['class1', 'class2']}}
```

property label_map

```
to\_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.ModelFeedback module

class aisquared.config.feedback.ModelFeedback.ModelFeedback

```
Bases: BaseObject
```

Feedback object for questions and answers for an individual model.

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.ModelFeedback()
>>> my_obj.add_question(
    'How is the model performing?',
    choices = ['very poorly', 'poorly', 'neutral', 'well', 'very well']
)
>>> my_obj.add_question(
    'Any additional feedback?',
    'text'
)
>>> my_obj.to_dict()
{'className': 'ModelFeedback',
'params': {'questions': [{'question': 'How is the model performing?',
'answerType': 'singleChoice',
'choices': ['very poorly', 'poorly', 'neutral', 'well', 'very well']},
{'question': 'Any additional feedback?', 'answerType': 'text'}]}
```

```
add_question(question: str, answer_type: str = 'singleChoice', choices: list = [])
Add a question to be asked.
```

Parameters

- **question** (*str*) The question to be asked.
- answer_type (str (default 'singleChoice')) One of either 'singleChoice', 'multiChoice', or 'text'
- **choices** (list (default [])) The choices to be provided, if answer_type is 'single-Choice' or 'multiChoice'

```
to_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.MulticlassFeedback module

class aisquared.config.feedback.MulticlassFeedback.MulticlassFeedback(label_map: list)

Bases: BaseObject

Feedback for multiclass classification

Example Usage:

property label_map

```
to\_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.QualitativeFeedback module

 ${\bf class} \ {\bf aisquared.config.feedback.Qualitative Feedback.Qualitative Feedback}$

Bases: BaseObject

Feedback object for questions and answers for individual predictions.

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.QualitativeFeedback()
>>> my_obj.add_question('Any additional feedback?', 'text')
>>> my_obj.to_dict()
{'className': 'QualitativeFeedback',
'params': {'questions': [{'question': 'Any additional feedback?',
'answerType': 'text'}]}}
```

```
add_question(question: str, answer_type: str = 'singleChoice', choices: list = []) Add a question to be asked.
```

Parameters

- **question** (*str*) The question to be asked.
- answer_type (str (default 'singleChoice')) One of either 'singleChoice', 'multiChoice', or 'text'
- **choices** (*list* (*default* [])) The choices to be provided, if *answer_type* is 'single-Choice' or 'multiChoice'

```
to_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.RegressionFeedback module

class aisquared.config.feedback.RegressionFeedback.RegressionFeedback

Bases: BaseObject

Feedback for regression

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.RegressionFeedback()
>>> my_obj.to_dict()
{'className': 'RegressionFeedback', 'params': {}}
```

```
to_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.SimpleFeedback module

class aisquared.config.feedback.SimpleFeedback

```
Bases: BaseObject
```

Simple thumbs-up/thumbs-down feedback for predictions

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.SimpleFeedback()
>>> my_obj.to_dict()
{'className': 'SimpleFeedback', 'params': {}}
```

```
\textbf{to\_dict()} \rightarrow dict
```

Return the object as a dictionary

Module contents

The aisquared.config.feedback subpackage contains objects for configuring feedback in aisquared models.

aisquared.config.harvesting package

Submodules

aisquared.config.harvesting.ChatbotHarvester module

```
{\bf class} \ {\bf aisquared.config.harvesting.Chatbot Harvester. {\bf Chatbot Harvester}({\it title},
```

harvest_history=False, input_type='text', features=None, max_length=None)

Bases: BaseObject
Harvesting for a chatbot
to_dict()

Return the configuration object as a dictionary

aisquared.config.harvesting.lmageHarvester module

```
class aisquared.config.harvesting.ImageHarvester.ImageHarvester(how: str = 'all')
```

Bases: BaseObject

Object to harvest images

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.ImageHarvester()
>>> my_obj.to_dict()
{'className': 'ImageHarvester', 'params': {'how' : 'all'}}
```

property how

```
\textbf{to\_dict()} \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.harvesting.lnputHarvester module

```
class aisquared.config.harvesting.InputHarvester.InputHarvester(input_type: str = 'text', max\_length: int \mid None = None, features: list \mid None = None)
```

Bases: BaseObject

Object to harvest user-input text

Example usage:

```
>>> import aisquared
     >>> my_obj = aisquared.config.harvesting.InputHarvester()
     >>> my_obj.to_dict()
     {'className': 'InputHarvester',
     'params': {'inputType': 'text', 'maxLength': None, 'features': None}}
     property features
     property input_type
     property max_length
     \textbf{to\_dict()} \rightarrow dict
          Get the configuration object as a dictionary
aisquared.config.harvesting.QueryParameterHarvester module
class aisquared.config.harvesting.QueryParameterHarvester.QueryParameterHarvester(query_keys:
                                                                                           str | list,
                                                                                           url_locations:
                                                                                           str | list,
                                                                                           at-
                                                                                           tributes:
                                                                                           str | list)
     Bases: BaseObject
     Harvester for Query Parameters
     Example usage:
     >>> import aisquared
     >>> my_obj = aisquared.config.harvesting.QueryParameterHarvester(
         'test_key',
          'test_url',
         'test_attribute'
     >>> my_obj.to_dict()
     {'className': 'QueryParameterHarvester',
     'params': {'queryKeys': ['test_key'],
     'urlLocations': ['test_url'],
     'attributes': ['test_attribute']}}
     property attributes
     property query_keys
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
```

1.1. aisquared 13

property url_locations

aisquared.config.harvesting.TextHarvester module

```
class aisquared.config.harvesting.TextHarvester.TextHarvester(how: str = 'all', regex: str \mid None = None, flags: str = 'gu', body\_only: bool = False, keywords: str \mid list \mid None = None, limit: int \mid None = None)
```

Bases: BaseObject
Object to harvest text

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.TextHarvester(
   how = 'all',
   body_only = True
)
>>> my_obj.to_dict()
{'className': 'TextHarvester',
   'params': {'how': 'all',
   'regex': None,
   'flags': 'gu',
   'bodyOnly': True,
   'limit': None}}
```

```
property body_only
property flags
property how
property limit
property regex
to_dict() → dict
Get the configuration object as a dictionary
```

Module contents

The aisquared.config.harvesting subpackage contains objects for configuring harvesting of data.

aisquared.config.postprocessing package

Submodules

aisquared.config.postprocessing.BinaryClassification module

```
class aisquared.config.postprocessing.BinaryClassification.BinaryClassification(label_map: list, threshold: float = 0.5
```

```
Bases: BaseObject
```

Postprocesssing configuration object for binary classification

Example usage

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.BinaryClassification(
    ['class1', 'class2']
)
>>> my_obj.to_dict()
{'className': 'BinaryClassification',
    'params': {'labelMap': ['class1', 'class2'], 'threshold': 0.5}}
```

```
property label_map
```

property threshold

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.postprocessing.MulticlassClassification module

Bases: BaseObject

Postprocessing configuration object for multiclass classification

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.MulticlassClassification(
    ['class1', 'class2', 'class3']
)
>>> my_obj.to_dict()
{'className': 'MulticlassClassification',
    'params': {'labelMap': ['class1', 'class2', 'class3']}}
```

property label_map

```
\textbf{to\_dict()} \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.postprocessing.ObjectDetection module

class aisquared.config.postprocessing.ObjectDetection.ObjectDetection($label_map: list, threshold: float = 0.5$)

Bases: BaseObject

Postprocessing configuration object for object detection

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.ObjectDetection(
    ['class1', 'class2', 'class3']
)
>>> my_obj.to_dict()
{'className': 'ObjectDetection',
    'params': {'labelMap': ['class1', 'class2', 'class3'], 'threshold': 0.5}}

property label_map
property threshold
```

 $\textbf{to_dict()} \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.postprocessing.Regression module

```
class aisquared.config.postprocessing.Regression.Regression(min: int \mid float \mid None = None, max: int \mid float \mid None = None, round: bool = False)
```

Bases: BaseObject

Postprocessing configuration object for Regression

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.Regression(
    10,
    100
)
>>> my_obj.to_dict()
{'className': 'Regression', 'params': {'min': 10, 'max': 100, 'round': False}}
```

```
property max
```

property min

property round

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

Module contents

The aisquared.config.postprocessing subpackage contains objects for configuring how predictions are postprocessed.

aisquared.config.preprocessing package

Subpackages

aisquared.config.preprocessing.image package

Submodules

aisquared.config.preprocessing.image.ImagePreprocessing module

Bases: BaseObject

Preprocesser object for image data

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.image.AddValue(255.0)
)
```

add_step(step)

Add a step to the preprocesser object

property step_dict

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.preprocessing.image.Steps module

```
class aisquared.config.preprocessing.image.Steps.AddValue(value: int | float)
```

Bases: BaseObject

Preprocessing step to add a value to all pixels in an image

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.image.AddValue(255.0)
)
```

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

property value

```
class aisquared.config.preprocessing.image.Steps.ConvertToColor(color: str)
     Bases: BaseObject
     Preprocessing step to convert images to a color scheme
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.ConvertToColor('RGB')
     property color
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.image.Steps.DivideValue(value: int | float)
     Bases: BaseObject
     Preprocessing step to divide all pixels in an image by a value
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.DivideValue(255.0)
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
class aisquared.config.preprocessing.image.Steps.MultiplyValue(value: int | float)
     Bases: BaseObject
     Preprocessing step to multiply all pixels in an image by a value
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.MultiplyValue(2.0)
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
class aisquared.config.preprocessing.image.Steps.Resize(size: list, method: str = 'bilinear',
                                                               preserve \ aspect \ ratio: bool = False)
     Bases: BaseObject
     Preprocessing step to resize an image
```

```
>>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.Resize([100, 100])
     property method
     property preserve_aspect_ratio
     property size
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.image.Steps.SubtractValue(value: int | float)
     Bases: BaseObject
     Preprocessing step to subtract a value from all pixels in an image
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocesser()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.SubtractValue(255.0)
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
```

Module contents

The aisquared.config.preprocessing.image subpackage contains objects for configuring image preprocessing.

aisquared.config.preprocessing.tabular package

Submodules

aisquared.config.preprocessing.tabular.Steps module

```
class aisquared.config.preprocessing.tabular.Steps.DropColumn(column: int)
    Bases: BaseObject
    Drop a column from tabular data
    Example usage:
```

(continued from previous page)

property column

```
to_dict() \rightarrow dict
```

Get the configuration object as a dictionary

class aisquared.config.preprocessing.tabular.Steps.MinMax(mins: list, maxs: list, columns: list | None = None)

Bases: BaseObject

Min-Max Scaling preprocessing step

Min-Max Scaling takes all associated columns and maps values relative to the minimum and maximum values of the training data.

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.tabular.MinMax(
        [0, 1.1, 2],
        [0.2, 14, 18.3]
)
)
```

property columns

property maxs

property mins

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

class aisquared.config.preprocessing.tabular.Steps.OneHot(column: int, values: list)

Bases: BaseObject

One Hot encoding preprocessing step

Example usage:

property column

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

property values

class aisquared.config.preprocessing.tabular.Steps.**ZScore**(means: list, stds: list, columns: int | list | None = None)

Bases: BaseObject

Z-Score normalization preprocessing step

Z-Score normalization takes each supplied column value, subtracts that column's provided mean, and divides by the provided standard deviation.

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.tabular.ZScore(
        [0, 1, 2],
        [0.2, 0.4, 0.6]
    )
)
```

```
property columns
```

property means

property stds

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.preprocessing.tabular.TabularPreprocessing module

 $\textbf{class} \ \texttt{aisquared.config.preprocessing.tabular.TabularPreprocessing.} \textbf{TabularPreprocesser} (\textit{steps:} \\$

list |

None

= None)

Bases: BaseObject

Preprocesser object for tabular data

Example usage:

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.tabular.ZScore(
        [0, 1, 2],
        [0.2, 0.4, 0.6]
    )
)
```

```
add_step(step)
    Add a step to the preprocesser object
to_dict()
    Get the configuration object as a dictionary
```

Module contents

The aisquared.config.preprocessing.tabular subpackage contains objects for preprocessing tabular data.

aisquared.config.preprocessing.text package

Submodules

aisquared.config.preprocessing.text.Steps module

```
class aisquared.config.preprocessing.text.Steps.ConvertToCase(lowercase: bool = True)
    Bases: BaseObject
```

Text preprocessing object to convert inputs to all lowercase or all uppercase

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.text.TextPreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.text.ConvertToCase()
)
```

property lowercase

```
\textbf{to\_dict()} \rightarrow dict
```

Get the configuration object as a dictionary

```
class aisquared.config.preprocessing.text.Steps.ConvertToVocabulary(vocabulary: dict, start_character: int = 1, oov_character: int = 2, max_vocab: int | None = None)
```

Bases: BaseObject

Text preprocessing object to convert tokens to integer vocabularies

Example usage:

(continues on next page)

(continued from previous page)) property max_vocab property oov_character property start_character $to_dict() \rightarrow dict$ Get the configuration object as a dictionary property vocabulary **class** aisquared.config.preprocessing.text.Steps.**PadSequences**(pad_character: int = 0, length: int = 128, $pad_location$: str = 'post', $truncate_location: str = 'post')$ Bases: BaseObject Text preprocessing object to pad sequences Example usage: >>> import aisquared >>> preprocesser = aisquared.config.preprocessing.text.TextPreprocesser() >>> preprocesser.add_step(aisquared.config.preprocessing.text.PadSequences() property length property pad_character property pad_location $to_dict() \rightarrow dict$ Get the configuration object as a dictionary property truncate_location **class** aisquared.config.preprocessing.text.Steps.**RemoveCharacters**(remove_digits: bool = True, remove punctuation: bool = True) Bases: BaseObject Preprocessing step to remove characters from text Example usage: >>> import aisquared >>> preprocesser = aisquared.config.preprocessing.text.TextPreprocesser() >>> preprocesser.add_step(aisquared.config.preprocessing.text.RemoveCharacters()

1.1. aisquared 23

property remove_digits

```
property remove_punctuation
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.text.Steps.Tokenize(split_sentences: bool = False,
                                                                   split \ words: bool = True, token \ pattern:
                                                                   str = \langle x08 \rangle \langle w \rangle \langle w + \langle x08' \rangle
     Bases: BaseObject
     Preprocessing Step to tokenize text
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.text.TextPreprocesser()
     >>> preprocesser.add_step(
          aisquared.config.preprocessing.text.Tokenize()
     property split_sentences

          Get the configuration object as a dictionary
aisquared.config.preprocessing.text.TextPreprocessing module
class aisquared.config.preprocessing.text.TextPreprocessing.TextPreprocesser(steps: list |
                                                                                           None = None)
     Bases: BaseObject
     Preprocesser object for natural language
     Example usage:
```

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.text.TextPreprocesser()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.text.Tokenize()
)

add_step(step)
   Add a step to the preprocesser object

property step_dict

to_dict() → dict
   Get the configuration object as a dictionary
```

Module contents

The aisquared.config.preprocessing.text subpackage contains objects for preprocessing text data.

Module contents

The aisquared.config.preprocessing subpackage contains utilities to configure the preprocessing of data in the data pipeline. It contains

three separate subpackages, aisquared.config.preprocessing.text, aisquared.config.preprocessing.image, and aisquared.config.preprocessing.tabular, which configure the preprocessing of different types of data.

aisquared.config.rendering package

Submodules

aisquared.config.rendering.BarChartRendering module

```
class aisquared.config.rendering.BarChartRendering.BarChartRendering(label: str, id: str,
```

chart_name: str, container id: str, prediction name key: str, prediction_value_key: str, prediction_name_value: str, display_legend: bool, legend_icon: str, labels_key: str | None = *None*, *width:* str = 'auto', height: str = 'auto',xOffset: str = '0', yOffset:str = '0', labels: list | None= None,consolidate rows: bool = *True*, css_params: dict | None = None)

Bases: BaseObject

Rendering class for rendering a Bar Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.BarChartRendering(
    'my_label',
    'my_id',
    'my_bar_chart',
    'my_container_id',
    'name',
    'value',
    'name_value',
    True,
    'circle'
>>> my_obj.to_dict()

    'predictionNameValue': 'name_value'}]}}
```

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.FilterRendering module

Bases: BaseObject

Object which dictates how predictions are to be passed to downstream analytics

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.FilterRendering(
    'inputs',
```

(continues on next page)

(continued from previous page)

```
'key',
    'gt',
    0.2
)
>>> my_obj.to_dict()
{'className': 'FilterRendering',
    'params': {'source': 'inputs', 'key': 'key', 'qualifier': 'gt', 'value': 0.2}}

property key
property qualifier
property source
to_dict() → dict
    Get the configuration object as a dictionary
property value
```

aisquared.config.rendering.HTMLTagRendering module

Bases: BaseObject
Rendering for HTML tags

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.HTMLTagRendering(
    'my HTML tag',
    'MyHTMLTagRenderingID',
    'MyContainerID',
    'Example Text',
    'extra_tag',
    'append',
    'name_key',
    'value_key',
    'name_value'
>>> my_obj.to_dict()
{'className': 'HTMLTagRendering',
'label': 'my HTML tag',
'params': {'id': 'MyHTMLTagRenderingID',
                                                                         (continues on next page)
```

(continued from previous page)

```
'containerId': 'MyContainerID',
'htmlContent': 'Example Text',
'extraContentTag': 'extra_tag',
'injectionAction': 'append',
'predictionNameKey': 'name_key',
'predictionValueKey': 'value_key',
'predictionNameValue': 'name_value',
'content': ''}}
```

```
\textbf{to\_dict()} \rightarrow dict
```

Return the configuration object as a dictionary

aisquared.config.rendering.ImageRendering module

Bases: BaseObject

Object which dictates how to render images

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.ImageRendering()
>>> my_obj.to_dict()
{'className': 'ImageRendering',
'params': {'color': 'blue',
'thickness': '5',
'placement': 'bottomleft',
'includeProbability': False,

'fontColor': 'black',
'fontSize': '5',
'classes': None,
'thresholdKey': None,
'thresholdValue': None}}
```

```
property badge_color
property classes
property color
property font_color
property font_size
```

```
property include_probability
property placement
property thickness
property threshold_key
property threshold_value

to_dict() → dict
Get the configuration object as a dictionary
```

aisquared.config.rendering.LineChartRendering module

class aisquared.config.rendering.LineChartRendering.LineChartRendering(label: str, id: str,

chart_name: str, container id: str. prediction_name_key: prediction_value_key: str, prediction_name_value: str, display_legend: bool, legend_icon: str, labels_key: str, width: str = 'auto', height: str= 'auto', xOffset: str = '0', yOffset: str = '0', labels: list | None = None, consolidate_rows: bool = True, css_params: $dict \mid None = None$)

Bases: BaseObject

Rendering class for rendering a Line Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.LineChartRendering(
    'my_label',
    'my_id',
    'my_line_chart',
    'my_container_id',
    'name',
    'value',
    'name_value',
    True,
    'circle',
    'labels'
)
>>> my_obj.to_dict()
(continues on next page)
```

(continued from previous page)

```
{'className': 'LineChartRendering',
'label': 'my_label',
'params': {'id': 'my_id',
'chartName': 'my_line_chart',
'containerId': 'my_container_id',
'displayLegend': True,
'legendIcon': 'circle',
'width': 'auto',
'height': 'auto',
'x0ffset': '0',
'yOffset': '0',
'datasource': [{'labels': None,

    'predictionNameKey': 'name',
    'predictionValueKey': 'value',
    'predictionNameValue': 'name_value'}]}}
```

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.ObjectRendering module

Bases: BaseObject

Object which dictates how to render object detection in images

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.ObjectRendering()
>>> my_obj.to_dict()
{'className': 'ObjectRendering',
   'params': {'color': 'blue',
   'thickness': '5',
   'placement': 'bottomleft',
   'includeProbability': False,
   'badgeColor': 'white',
   'fontColor': 'black',
   'fontSize': '5'}}
```

property badge_color

property color

```
property font_color
property font_size
property include_probability
property placement
property thickness
to_dict() → dict
    Get the configuration object as a dictionary
```

aisquared.config.rendering.PieChartRendering module

```
class aisquared.config.rendering.PieChartRendering.PieChartRendering(label: str, id: str,
```

chart_name: str, container id: str. prediction_name_key: str, prediction_value_key: str, prediction_name_value: str, display_legend: bool, legend_icon: str, labels_key: str | None = *None*, *width*: str = 'auto', height: str = 'auto',xOffset: str = '0', yOffset:str = '0', labels: list | None= None, $consolidate_rows:\ bool =$ *True*, css_params: dict | None = None)

Bases: BaseObject

Rendering class for rendering a Pie Chart

Example usage:

1.1. aisquared 37

(continues on next page)

(continued from previous page)

```
'chartName': 'my_doughnut_chart',
'containerId': 'my_container_id',
'displayLegend': True,
'legendIcon': 'circle',
'width': 'auto',
'height': 'auto',
'xOffset': '0',
'yOffset': '0',

    'labelsKey': None,
    'consolidateRows': True,
    'predictionNameKey': 'name',
    'predictionValueKey': 'value',
    'predictionNameValue': 'name_value'}]}}
```

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.SOSRendering module

```
class aisquared.config.rendering.SOSRendering.SOSRendering(can\_toggle: bool, label: str = ")
```

Bases: BaseObject

Rendering of an SOS dashboard

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.SOSRendering(True)
>>> my_obj.to_dict()
{'className': 'SOSRendering', 'label': '', 'params': {'canToggle': True}}
```

property can_toggle

property label

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.TableRendering module

Bases: BaseObject

Class for rendering tables

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.TableRendering(
   'my table',
    'MyTableID',
    'MyContainerID',
    'name_key',
    'value_key',
    'name_values'
>>> my_obj.to_dict()
{'className': 'TableRendering',
'label': 'my table',
'params': {'id': 'MyTableID',
'containerId': 'MyContainerID',
'predictionNameKey': 'name_key',
'predictionValueKey': 'value_key',
'predictionNameValues': 'name_values',
'tableName': ''}}
```

 $\textbf{to_dict()} \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.TextRendering module

Bases: BaseObject

Class for rendering text

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.TextRendering(
    prediction_value_key = 'my_key'
)
>>> my_obj.to_dict()
{'className': 'TextRendering',
    'params': {'predictionValueKey': 'my_key'}}
```

property prediction_value_key

```
to_dict()
```

Get the object as a dictionary

aisquared.config.rendering.WordRendering module

```
class aisquared.config.rendering.WordRendering.WordRendering(word_list: str = 'input', result_key:
                                                                      str | None = None, content_key: str |
                                                                     None = None, badge\_shape: str =
                                                                      'star', badge_color: str = 'blue',
                                                                      classes: list \mid None = None,
                                                                      threshold key: str \mid None = None,
                                                                      threshold_value: int | float | None =
                                                                     None, position: str = 'after')
     Bases: BaseObject
     Object for rendering badges on individual words
     Example usage:
     >>> import aisquared
     >>> my_obj = aisquared.config.rendering.WordRendering()
     >>> my_obj to_dict()
     {'className': 'WordRendering',
     'params': {'wordList': 'input',

     'thresholdValue': None
     'position': 'after'}}
     property badge_color
     property badge_shape
     property classes
     property content_key
     property position
     property result_key
     property threshold_key
     property threshold_value
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property word_list
```

aisquared.config.rendering.utils module

```
aisquared.config.rendering.utils.save_default_css()
```

Save default CSS so that default CSS can be edited and automatically utilized with changes

Notes

• Saves all CSS files to the ~/.aisquared/ directory

Module contents

The aisquared.config.rendering subpackage contains objects for configuring how rendering of predictions is to occur.

Submodules

aisquared.config.CustomObject module

Bases: BaseObject

Custom class that allows the user to define custom classes for configuration

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.base.CustomObject(
    'MyClass',
    key1 = 'foo',
    key2 = 'bar'
    )
>>> my_obj.to_dict()
{'className': 'MyClass', 'params': {'key1': 'foo', 'key2': 'bar'}}
)
```

```
to_dict() \rightarrow dict
```

Get the object as a dictionary

aisquared.config.GraphConfiguration module

```
Bases: BaseObject
```

Configuration object for deploying a set of processing steps and/or analytics as a dependency graph

```
add_node(step: BaseObject, dependencies: int | list | None = None) \rightarrow int
```

Add a node to the configuration graph

Parameters

- **step** (aisquared configuration step) The step to add
- **dependencies** (*int*, *list of int*, *or None*) The ids of nodes which must be run before the added node

Returns

node_id - The integer id of the node that is added

Return type

int

property auto_run

```
compile(filename: str \mid None = None, dtype: str \mid None = None) \rightarrow None
```

Compile the object into a '.air' file, which can then be dragged and dropped into applications using the AI Squared JavaScript SDK

Parameters

- **filename** (path-like or None (default None)) Filename to compile to. If None, defaults to '{NAME}.air', where {NAME} is the name of the analytic
- **dtype** (*str or None* (*default None*)) The datatype to use for the model weights when using a Keras model. If None, defaults to 'float32'

```
property description
```

```
property documentation_link
```

```
get_filenames() \rightarrow list
```

Get filenames for all models in the configuration

```
property mlflow_token
```

property mlflow_uri

property mlflow_user

property name

property owner

property stage

 $to_dict() \rightarrow dict$

Get the object as a dictionary

property url

property version

aisquared.config.ModelConfiguration module

class aisquared.config.ModelConfiguration.ModelConfiguration(name: str, harvesting_steps:

BaseObject | list | None = None, preprocessing_steps: BaseObject | *list* | *None* = *None*, *analytic*: BaseObject | list | None = None, postprocessing steps: BaseObject | *list* | *None* = *None*, *rendering_steps*: BaseObject | list | None = None, feedback_steps: BaseObject | list | None = None, stage: str ='experimental', version: int | None = *None, description:* str = ", $mlflow \ uri: str \mid None = None,$ $mlflow_user: str \mid None = None,$ $mlflow_token: str \mid None = None,$ $owner: str \mid None = None, url: str =$ '*', $auto_run$: bool = False, $documentation_link: str = ",$ warnings: list | None = None)

Bases: BaseObject

Configuration object for deploying a model or analytic

```
property analytic
```

property analytic_dict

property auto_run

compile($filename: str \mid None = None, dtype: str \mid None = None) \rightarrow None$

Compile the object into a '.air' file, which can then be dragged and dropped into applications using the AI Squared JavaScript SDK

Parameters

- **filename** (*path-like or None* (*default None*)) Filename to compile to. If None, defaults to '{NAME}.air', where {NAME} is the name of the analytic
- **dtype** (*str or None* (*default None*)) The datatype to use for the model weights. If None, defaults to 'float32'

```
property description
property documentation_link
property feedback_dict
property feedback_steps
get_model_filenames() → list
    Get filenames for all models in the configuration
property harvester_dict
property harvesting_steps
```

```
property mlflow_token
property mlflow_uri
property mlflow_user
property name
property owner
property postprocesser_dict
property postprocessing_steps
property preprocesser_dict
property preprocessing_steps
property render_dict
property rendering_steps
property stage
\textbf{to\_dict()} \rightarrow dict
    Get the object as a dictionary
property url
property version
property warnings
```

Module contents

The aisquared.config subpackage contains utilities and objects for packaging aisquared configuration steps and models.

For in-depth examples of how to build out .air files using the utilities and classes in this library, please visit our GitHub repository at https://github.com/AISquaredInc/airFiles

aisquared.logging package

Module contents

The aisquared.logging subpackage contains utilities for performing experiments within aisquared.

This functionality is inhereted from MLFlow. Please see the MFLow documentatation at https://mlflow.org.

aisquared.platform package

Submodules

aisquared.platform.AISquaredAPIException module

```
exception aisquared.platform.AISquaredAPIException.AISquaredAPIException
Bases: Exception
```

aisquared.platform.AISquaredPlatformClient module

Bases: object

Client for interacting with the AI Squared platform programmatically

When using the client for the first time, it is important to run the *client.login()* method. When doing so, the client will ask for any required information interactively.

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> # If you have never logged in before, run the following code:
>>> client.login()
>>> # Test connection
>>> client.test_connection()
True
```

add_users_to_group($group_id: str, user_ids: list, port: int = 8086, use_port: bool | None = None) <math>\rightarrow$ bool Add users to a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.add_users_to_group('group_id', ['user_id_1', 'user_id_2'])
True
```

Parameters

- **group_id** (str) The group to add the users to
- user_ids (list of str) The IDs of the users to add
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Returns True if operation was successful

Return type

bool

property base_url: str

The base URL associated with the client

create_group($display_name: str, role_id: str, port: int = 8086, use_port: bool | None = None) <math>\rightarrow$ dict Create a group in the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.create_group(
    'group display name',
    'role_id'
)
*dictionary containing group information*
```

Parameters

- **display_name** (*str*) The display name of the group
- role_id (str) The role ID for the group
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

group_info - Metadata about the created group

Return type

dict

create_user(user_name: str, given_name: str, family_name: str, email: str, role_id: str, active: bool = True, middle_name: str | None = None, company_id: str | None = None, password: str | None = None, port: int = 8085, use_port: bool | None = None) \rightarrow dict

Create a user within the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.create_user(
    'user name',
    'given_name',
    'family_name',
    'user_email',
    'role_id'
)
*Dictionary with user information*
```

Parameters

- **user_name** (*str*) The display name of the user
- **given_name** (str) The user's first name
- **family_name** (str) The user's last name
- **email** (str) The user's email
- **role_id** (*str*) The ID of the role to be given to the user

- active (bool (default True)) Whether the user is active
- middle_name (str or None (default None)) The user's middle name
- company_id(str or None (default None)) The user's company ID
- password (str or None (default None)) The user's password
- **port** (*int* (*default* 8085)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

user data - Metadata about the user

Return type

dict

 $delete_group(group_id, port=8086, use_port: bool | None = None) \rightarrow bool$

Delete a group from the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_group('group_id')
True
```

Parameters

- **group_id** (*str*) The ID of the group to delete
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

result - Returns True if successful

Return type

bool

 $delete_model(id: str, port: int = 8080, use_port: bool | None = None) \rightarrow bool$

Delete a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_model('model_id')
True
```

Parameters

- id (str) The ID for the model
- **port** (*int* (*default* 8080)) The API port for the model. This can be handled automatically by the platform ALB

• use_port (bool or None (default None)) – Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Whether the action was successful

Return type

bool

 $delete_user(user_id: str, port: int = 8085, use_port: bool | None = None) \rightarrow bool$

Delete a user from the system

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_user('user_id')
True
```

Parameters

- user_id (str) The user's ID
- **port** (*int* (*default* 8085)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

result – Returns True if the call is successful

Return type

bool

get_group($group_id: str, port: int = 8086, use_port: bool | None = None) <math>\rightarrow$ dict Retrieve information about a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_group('group_id')
*dictionary containing group data*
```

Parameters

- **group_id** (str) The ID of the group requested
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

group_info - The information about the group

Return type

dict

get_group_id_by_name($group_name: str, port: int = 8083, use_port: bool | None = None) <math>\rightarrow$ str Get the ID of a group by searching for its display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_group_id_by_name('Group Name')
*group_id*
```

Parameters

- **group_name** (str) The display name of the group
- **port** (*int* (*default* 8083)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

group_id – The ID of the group

Return type

str

 $\textbf{get_model}(\textit{id: str, port: int} = 8080, \textit{use_port: bool} \mid \textit{None} = \textit{None}) \rightarrow \textit{dict}$

Retrieve a model configuration

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model('model_id')
*JSON Response including model data and metadata*
```

Parameters

- **id** (*str*) The ID for the model
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

model – Metadata about the model coupled with the model's configuration information

Return type

dictionary

 $\texttt{get_model_id_by_name}(model_name: str, port: int = 8080, use_port: bool \mid None = None) \rightarrow str$ Retrieve a model's ID using the name of the model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model_id_by_name('my_awesome_model')
*model_id*
```

Parameters

- model_name (str) The name of the model
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

model id – The model's ID

Return type

str

get_role_id_by_role_name($role_name$: str, port: int = 8086, use_port : $bool \mid None = None$) \rightarrow str Get the ID of a role by searching for its display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_role_id_by_role_name('Role Name')
*role_id*
```

Parameters

- role_name (str) The name of the role
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

role_id - The ID of the role

Return type

str

get_user($user_id: str, port: int = 8085, use_port: bool | None = None) <math>\rightarrow$ dict Retrieve a user's information from the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user('user_id')
*dictionary with results*
```

Parameters

- user_id (str) The ID of the user
- **port** (*int* (*default* 8085)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

user_info - The information about the user

Return type

dict

get_user_id_by_name($name: str, port: int = 8080, use_port: bool | None = None) <math>\rightarrow$ str Get a user's ID from their display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user_id_by_name('User Name')
*user_id*
```

Parameters

- **name** (*str*) The display name of the user
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

id - The ID of the user

Return type

str

property headers

Headers used for authentication with the AI Squared Platform

 $\label{list_group_users} \textbf{(group_id: str, as_df: bool = True, port: int = 8083, use_port: bool \mid None = None)} \rightarrow \textbf{DataFrame} \mid \textbf{dict}$

List users in a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_group_users('group_id')
*DataFrame with results*
```

Parameters

- **group_id** (str) The ID for the group
- as_df (bool (default True)) Whether to return the response as a pandas DataFrame
- **port** (*int* (*default* 8083)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

users – The response from the API

Return type

pandas DataFrame or dictionary

 $\label{list_groups} \mbox{($max_count: int = 100, as_df: bool = True, port: int = 8083, use_port: bool | None = None)} \rightarrow \mbox{DataFrame | dict}$

List all groups

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_groups()
*DataFrame with results*
```

Parameters

- max_count (int (default 100)) The maximum number of groups to return
- as_df (bool (default True)) Whether to return the result as a pandas DataFrame
- **port** (*int* (*default* 8083)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

groups - The response from the API

Return type

pandas DataFrame or dictionary

list_model_feedback($model_id$: str, limit: int = 10, as_df : bool = True, port: int = 8080, use_port : $bool | None = None) \rightarrow dict | DataFrame$

List feedback on a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_feedback('model_id')
*DataFrame with Results*
```

Parameters

- model_id (str) The ID of the model
- limit (int (default 10)) The maximum number of feedback items to return
- port (int (default 8080)) The API port to use. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

feedback – The feedback

Return type

dict or pandas DataFrame

list_model_prediction_feedback($model_id$: str, as_df : bool = True, port: int = 8080, use_port : $bool | None = None) \rightarrow dict | DataFrame$

List all feedback for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_prediction_feedback('model_id')
*DataFrame with Results*
```

Parameters

- model_id (str) The ID of the model requested
- as_df (bool (default True)) Whether to return the results as a pandas DataFrame
- **port** (*int* (*default* 8080)) The API port to use. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

results – The results from the platform

Return type

dict or pandas DataFrame

list_model_usage_metrics($model_id$: str, period: str = 'hourly', as_df : bool = True, port: int = 8080, $use\ port$: $bool\ |\ None = None) \rightarrow dict\ |\ DataFrame$

Get usage metrics for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model_usage_metrics('model_id')
*DataFrame with results*
```

Parameters

- model_id (str) The ID of the model
- **period** (str (default 'hourly')) The period to group metrics into
- as_df (bool (default True)) Whether to return results as a pandas DataFrame
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

results – The results from the platform

Return type

pandas DataFrame or dict

 $\label{list_model_users} \textbf{(}\textit{id: str, as_df: bool = True, port: int = 8080, use_port: bool \mid None = None)} \rightarrow \\ \text{DataFrame | dict}$

List users for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_users('model_id')
*DataFrame with results*
```

Parameters

- **id** (*str*) The ID for the model
- as_df (bool (default True)) Whether to return the response as a Pandas DataFrame
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

model users – The users for the model

Return type

pandas DataFrame or dictionary

 $list_models(as_df: bool = True, port: int = 8080, use_port: bool | None = None) \rightarrow DataFrame | dict List models within the platform$

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_models()
*DataFrame with results*
```

Parameters

- as_df (bool (default True)) Whether to return the response as a pandas DataFrame
- **port** (*default None*) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

models – The models

Return type

pandas DataFrame or dictionary

list_prediction_feedback($prediction_id: str, as_df: bool = True, port: int = 8080, use_port: bool | None = None) <math>\rightarrow$ DataFrame | dict

List prediction feedback given a prediction ID

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_prediction_feedback('prediction_id')
*DataFrame with results*
```

Parameters

- **prediction_id** (*str*) The prediction ID
- as_df (bool (default True)) Whether to return the results as a pandas DataFrame
- **port** (*int* (*default* 8080)) The API port to use. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

results – The results from the platform

Return type

pandas DataFrame or dict

list_roles ($as_df: bool = True, port: int = 8086, use_port: bool | None = None) <math>\rightarrow$ DataFrame | dict List the roles available in the platform

Example usage:

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_roles()
*DataFrame with results*
```

Parameters

- as_df (bool (default True)) Whether to return the results as a pandas DataFrame
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port(bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

roles - The roles

Return type

pandas DataFrame or dict

 $\label{list_user_usage_metrics} \textbf{(}\textit{user_id: str, period: str = 'hourly', as_df: bool = True, port: int = 8080, \\ \textit{use_port: bool} \mid None = None) \rightarrow \text{dict} \mid \text{DataFrame} \\$

Get usage metrics for a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user_usage_metrics('user_id')
*DataFrame with results*
```

Parameters

- **user_id** (*str*) The ID of the user
- **period** (str (default 'hourly')) The period to group metrics into
- as_df (bool (default True)) Whether to return results as a pandas DataFrame

- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

results – The results from the platform

Return type

pandas DataFrame or dict

 $\label{list_users} \textbf{(max_count: int = 100, as_df: bool = True, port: int = 8080, use_port: bool \mid None = None)} \rightarrow \textbf{DataFrame} \mid \textbf{dict}$

List all users

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_users()
*DataFrame with results*
```

Parameters

- max_count (int (default 100)) The maximum number of users to return
- as_df (bool (default True)) Whether to return the data as a Pandas DataFrame
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

users – The response from the API

Return type

pandas DataFrame or dictionary

 $login(url: str \mid None = None, port: int = 8080, username: str \mid None = None, password: str \mid None = None, use_port: bool \mid None = None) \rightarrow None$

Log in to the platform programmatically. If no url, username, or password are provided, logs in interactively

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.login()
Enter URL: https://platform.squared.ai
Enter Username: your.email@your_domain.com
Enter Password: <hidden>
```

Parameters

- url (str or None (default None)) The URL for the platform API
- **port** (*int or None* (*default 8080*)) The API port for the call. This can be handled automatically by the platform ALB
- **username** (str or None (default None)) The username

- password (str or None (default None)) The password
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

property password: str

The password associated with the client

```
\begin{tabular}{ll} \textbf{remove\_users\_from\_group}(group\_id: str, user\_ids: list, port: int = 8086, use\_port: bool \mid None = None) \\ \rightarrow bool \\ \end{tabular}
```

Remove users from a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.remove_users_from_group('group_id', ['user_id_1', 'user_id_2'])
True
```

Parameters

- $group_id(str)$ The ID of the group
- **user_ids** (*list of str*) The IDs of the users to remove
- **port** (*int* (*default* = 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Returns True if successful

Return type

bool

```
share_model_with_group(model\_id: str, group\_id: str, port: int = 8080, use\_port: bool | None = None) <math>\rightarrow bool
```

Share a model with a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.share_model_with_group('model_id', 'group_id')
True
```

Parameters

- model_id (str) The ID for the model to be shared
- **group_id** (*str*) The ID for the group to be shared with. This can be handled automatically by the platform ALB
- **port** (*int* (*default* 8080)) The API port to use. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Returns True if successful

Return type

bool

 $share_model_with_user(model_id: str, user_id: str, port: int = 8080, use_port: bool | None = None) \rightarrow bool$

Share a model with a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.share_model_with_user('model_id', 'user_id')
True
```

Parameters

- model_id (str) The ID for the model
- **user_id** (*str*) The ID for the user
- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success – Whether the action was successful

Return type

bool

test_connection(port: int = 8080, use port: bool | None = None) \rightarrow bool

Test whether there is a healthy connection to the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.test_connection()
True
```

Parameters

- **port** (*int* (*default* 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - True if connection was successful

Return type

bool

property token: str

The token associated with the client

```
unshare\_model\_with\_group(model\_id: str, group\_id: str, port: int = 8080, use\_port: bool | None = None)
\rightarrow bool
```

Unshare a model with a group

```
>>> import aisquared
>>> client = aisquared.client.AISquaredPlatformClient()
>>> client.unshare_model_with_group('model_id', 'group_id')
True
```

Parameters

- model_id (str) The ID of the model
- **group_id** (str) The ID of the group
- port (int (default 8080)) The API port to use. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Returns True if successful

Return type

bool

unshare_model_with_user($model_id$: str, $user_id$: str, port: int = 8080, use_port : $bool \mid None = None$) \rightarrow bool

Unshare a model with a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.unshare_model_with_user('model_id', 'user_id')
True
```

Parameters

- model_id (str) The ID for the model
- **user_id** (*str*) The ID for the user
- port (int (default 8080)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Whether the action was successful

Return type

bool

update_group(group_id: str, display_name: str, role_id: str, port: int = 8086, use_port: bool | None = *None*) \rightarrow bool

Update information about a group

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.update_group(
```

1.1. aisquared 59

(continues on next page)

(continued from previous page)

```
'group_id',
'group display name',
'role_id'
)
True
```

Parameters

- **group_id** (str) The ID of the group to update
- **display_name** (*str*) The display name of the group
- role_id (str) The ID of the role for the group
- **port** (*int* (*default* 8086)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Returns True if successful

Return type

bool

update_user($user_id: str, user_name: str, given_name: str, family_name: str, email: str, role_id: str, active: bool = True, middle_name: str | None = None, company_id: str | None = None, password: str | None = None, port: int = 8085, use_port: bool | None = None) <math>\rightarrow$ bool

Update information about a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.update_user(
    'user_id',
    'user name',
    'given_name',
    'family_name',
    'user_email',
    'role_id'
)
True
```

Parameters

- **user_id** (*str*) The ID of the user to update
- **user_name** (*str*) The display name of the user
- **given_name** (*str*) The first name of the user
- **family_name** (*str*) The last name of the user
- **email** (*str*) The user's email
- role_id (str) The ID of the user's role
- active (bool (default True)) Whether the user is active

- middle_name (str or None (default None)) The user's middle name
- company_id(str or None (default None)) The user's company ID
- password (str or None (default None)) The user's password
- **port** (*int* (*default* 8085)) The API port for the call. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

success - Returns True if update is successful

Return type

bool

upload_model($model_file: str, port: int = 8081, use_port: bool | None = None) <math>\rightarrow$ str Upload a model to the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.upload_model('my_model_filename.air')
True
```

Parameters

- model_file (path or path-like) The path to the model file
- **port** (*int* (*default* 8081)) The API port to use. This can be handled automatically by the platform ALB
- use_port (bool or None (default None)) Whether to use port in URL formatting. If None, defaults to class value

Returns

successful – Whether the action was successful

Return type

bool

property use_port

Bases: Exception

```
property username: str
```

The username associated with the client

aisquared.platform.DatabricksAPIException module

 $\textbf{exception} \ \texttt{aisquared.platform.DatabricksAPIException.DatabricksAPIException}$

aisquared.platform.DatabricksClient module

class aisquared.platform.DatabricksClient.DatabricksClient

Bases: object

Client for working with a connected Databricks environment

When using the client for the first time, it is important to authenticate the client using the *client.login()* method. When doing so, the client will ask for any required information interactively.

```
>>> import aisquared
>>> client = aisquared.platform.DatabricksClient()
>>> # If you have never logged in before, run the following code:
>>> client.login()
>>> # Interactive session requesting required information
```

property base_url: str

The base URL for the workspace

 $create_compute(compute_name: str, spark_version: str, node_type_id: str) \rightarrow dict$

Create a compute resource

Parameters

- **compute_name** (*str*) The name of the compute to create
- **spark_version** (*str*) The spark version to use for the compute resource
- **node_type_id** (str) The node type ID to use

Returns

compute_info - The information about the created compute resource

Return type

dict

create_job(job_name : str, tasks: list, libraries: list, $compute_name$: str, $spark_version$: str, $node_type_id$: str, $cron_syntax$: $str \mid None = None$, timezone: $str \mid None = None$) \rightarrow bool

Create a job using notebooks and/or scripts in the workspace

Parameters

- **job_name** (str) The name for the job
- **tasks** (*list of dict*) List of {task_name : task_script} dictionary pairs to run in the job
- libraries (list of str) The dependent libraries to install on all compute
- **compute_name** (*str*) The name of the compute to provision specifically for this job
- **spark_version** (*str*) The version of Spark to use on the compute instances
- $node_type_id(str)$ The node type to use
- **cron_syntax** (*str or None* (*default None*)) If the job is to be set to a schedule, the cron syntax for that schedule
- **timezone** (*str or None* (*default None*)) The timezone to set the schedule to, if cron syntax is provided

Returns

success - Whether the create job call was successful

Return type

bool

 $create_served_model(model_name: str, model_version: str, workload_size: str, scale_to_zero_enabled: bool = True, workload_type: str = 'CPU') <math>\rightarrow$ dict

Create a model serving endpoint

Parameters

- model_name (str) The name of the model to serve
- **model_version** (*str*) The version of the model to serve
- workload_size (str) The workload size of the serving endpoint
- scale_to_zero_enabled (bool (default True)) Whether to allow for scaling the endpoint to zero
- type (workload) The workload type either 'CPU' or 'GPU'

Returns

configuration – Configuration information about the serving endpoint

Return type

dict

$delete_compute(compute_id: str) \rightarrow bool$

Delete a compute resource in the workspace

Parameters

 $compute_id(str)$ – The ID for the compute to delete

Returns

success – Whether the operation was successful

Return type

bool

$delete_from_workspace(filename: str) \rightarrow bool$

Delete a file from the workspace

Parameters

filename (str) – The name of the file to delete

Returns

success – Whether the operation is successful

Return type

bool

$delete_{job}(job_id: str) \rightarrow bool$

Delete a job from the workspace

Parameters

job_id (str) – The ID of the job to delete

Returns

success - Whether the delete operation was successful

Return type

bool

```
delete\_registered\_model(model\_name: str) \rightarrow bool
     Delete a registered model
         Parameters
             model_name (str) – The name of the model to delete
         Returns
             success - Whether the delete operation was successful
         Return type
             bool
delete\_served\_model(model\_name: str) \rightarrow bool
     Delete a served model in the workspace
         Parameters
             model_name(str) – The name of the model to delete
         Returns
             success – Whether the delete operation was successful
         Return type
             bool
download\_from\_workspace(filename: str) \rightarrow str
     Download a file from the workspace
         Parameters
              filename (str) – The filename of the file to download
         Returns
             contents - The contents of the file
         Return type
             str
property headers: dict
     API headers for calls to the API
list_compute(as\_df: bool = True) \rightarrow dict | DataFrame
     List compute in the workspace
         Parameters
             as_df (bool (default True)) – Whether to return a pandas DataFrame
             compute – The compute resources in the workspace
         Return type
             dict or pd.DataFrame
list_jobs(as\_df: bool = True) \rightarrow dict | DataFrame
     List all jobs in the workspace
         Parameters
             as_df (bool (default True)) – Whether to return a pandas DataFrame
         Returns
             jobs – The jobs that exist in the workspace
         Return type
             dict or pandas DataFrame
```

list_registered_models($as_df: bool = True$) \rightarrow dict | DataFrame

List registered models in the workspace

Parameters

as_df (bool (default True)) – Whether to return a pandas DataFrame

Returns

models – The models in the workspace

Return type

dict or pandas DataFrame

$list_served_models(as_df: bool = True) \rightarrow dict \mid DataFrame$

List served models in the workspace

Parameters

as_df (bool (default True)) – Whether to return results as a pandas DataFrame

Returns

models – The models served in the workspace

Return type

dict or pandas DataFrame

$list_workspace(as_df: bool = True) \rightarrow DataFrame | dict$

List files in the connected Databricks workspace

Parameters

as_df (bool (default True)) - Whether to return the results as a pandas DataFrame

Returns

results – The files in the workspace

Return type

dict or pd.DataFrame

```
login(url: str \mid None = None, username: str \mid None = None, token: str \mid None = None, persist: bool = True) \rightarrow None
```

Log in to the Databricks environment programmatically

```
>>> import aisquared
>>> client = aisquared.platform.DatabricksClient()
>>> client.login()
Enter URL: {Databricks_workspace_url}
Enter Username: your.email@your_domain.com
Enter Secret Token: <hidden>
```

Parameters

- url (str or None (default None)) The URL of the Databricks workspace
- username (str or None (default None)) The username in the Databricks workspace
- token (str or None (default None)) The secret token for the Databricks workspace
- **persist** (*bool* (*default True*)) Whether to persist the login information, eliminating the need to run this command again in the future

run_job($job_id: str$) \rightarrow int

```
Run a job
         Parameters
              job_id (str) – The ID of the job to run
         Returns
              run_id - The ID of the specific run that was created
         Return type
              int
start\_compute(compute\_id: str) \rightarrow bool
     Start a compute resource
         Parameters
              compute_id (str) – The ID of the compute to start
         Returns
             success – Whether the start operation was successful
         Return type
              bool
stop\_compute(compute\_id: str) \rightarrow bool
     Stop a compute resource
         Parameters
              compute_id (str) – The ID of the compute to start
         Returns
             success – Whether the stop operation was successful
         Return type
              bool
property token: str
     The token to use for the workspace
update_job(job_id: int, job_name: str, tasks: list, libraries: list, compute_name: str, spark_version: str,
              node type id: str, cron syntax: str | None = None, timezone: str | None = None) \rightarrow bool
     Update a job by Job ID using notebooks and/or scripts in the workspace
         Parameters
              • job_id (int) – The unique identifier of the job to update
              • job_name (str) - The new name for the job
              • tasks (list of dict) - List of {task_name: task_script} dictionary pairs to run in the
                updated job
              • libraries (list of str) – The dependent libraries to install on all compute for the
                new job
```

• compute_name (str) – The name of the compute to provision specifically for the new job

• cron_syntax (str or None (default None)) – If the new job is to be set to a sched-

• spark_version (str) – The version of Spark to use on the compute instances

• **node_type_id** (*str*) – The node type to use

ule, the cron syntax for that schedule

Chapter 1. Installation

• **timezone** (*str or None* (*default None*)) – The timezone to set the schedule to, if cron syntax is provided

Returns

success – Whether the update job call was successful

Return type

bool

 $upload_to_workspace(filename: str, overwrite: bool = False) \rightarrow bool$

Upload a file to the workspace

Parameters

- **filename** (*str*) The name of the file to upload
- **overwrite** (*bool* (*default False*)) Whether to overwrite the file if one of the same name already exists in the workspace

Returns

success - Whether the upload was successful

Return type

bool

property username: str

The user's username

aisquared.platform.NoResultsFoundError module

 $\textbf{exception} \ \, \text{aisquared.platform.NoResultsFoundError.} \\ \textbf{NoResultsFoundError} \\ \textbf{.} \\ \textbf{NoResultsFoundError} \\ \textbf{.} \\ \textbf{.} \\ \textbf{NoResultsFoundError} \\ \textbf{.} \\ \textbf{$

Bases: Exception

aisquared.platform.additional utils module

aisquared.platform.crudl module

aisquared.platform.feedback module

aisquared.platform.metrics module

aisquared.platform.sharing module

aisquared.platform.user_group module

Module contents

Utilities for interacting with the AI Squared Platform.

The primary class within this subpackage is the *AISquaredPlatformClient* class, which has the capabilities to interact with much of the functionality in the AI Squared platform. For more information about this class, please see its documentation.

aisquared.serving package

Submodules

aisquared.serving.deploy model module

```
aisquared.serving.deploy_model.deploy_model(saved\_model: str, model\_type: str, host: str = '127.0.0.1', port: int = 2244, custom\_objects: dict \mid None = None, additional\_functions\_file: str \mid None = None)
```

Deploy a model to a Flask server on the specified host

Parameters

- **saved_model** (*Path-like*) The path to the saved model directory or model file
- model_type (str) The type of model
- host (str (default '127.0.0.1')) The host to deploy to
- port (int (default 2244)) The port to deploy to
- **custom_objects**(*dict or None* (*default None*)) Any custom objects to load when using a BeyondML model
- additional_functions_file (file-like or None (default None)) File name containing additional functions (which have to be named preprocess and postprocess, if created) that are used during the prediction process

aisquared.serving.deploy_model.load_beyondml_model(model: str, custom_objects: dict)

Load a BeyondML model with custom objects

aisquared.serving.get_remote_prediction module

```
aisquared.serving.get_remote_prediction.get_remote_prediction(data: dict \mid str \mid ndarray \mid list, host: str = '127.0.0.1', port: int = 2244') <math>\rightarrow list
```

Send data to use for prediction

Parameters

- data (dict, str, np.ndarray, or list) The data to be predicted on
- **host** (*str* (*default* '127.0.0.1')) The host to use
- port (int (default '2244')) The port to use

Notes

- If data is a dictionary, it is expected to already be correctly formatted
- If data is a string, it is expected to already be correctly formatted

Returns

predictions – The predictions from the deployed model

Return type

list

Module contents

The aisquared serving package contains utilities to serve models to a local REST endpoint.

Here is an example of how to serve a simple keras model using these utilities:

```
>>> # Assume model is already trained and stored in memory as model
>>> from aisquared import serving
>>> serving.save_keras_model(model, 'my_model')
>>> serving.deploy_model(
    'my_model',
    'keras',
    additional_functions_file = '<optional file containing `preprocess` and_
    ¬`postprocess` functions, if applicable>'
)
App created successfullly. Serving and awaiting requests
```

And to retrieve predictions from the model:

```
>>> # From a separate terminal, assume data is already loaded
>>> from aisquared import serving
>>> serving.get_remote_predictions(data) # Do not need to change host or port if_
--predicting from the same machine
*predictions*
```

aisquared.utils package

Submodules

aisquared.utils.utils module

```
aisquared.utils.utils.get_model(model_type: str, input_shape: int | tuple, num_outputs: int,
output_activation: str, size: str = 'small', vocab_size: None | int = None)
```

Get a pre-configured model for different use cases

Parameters

- model_type (str) Either 'cv', 'nlp_embedding', or 'fc', defining the model type
- input_shape (int or tuple of int) The input shape to the model
- **num_outputs** (*int*) The output shape of the model
- output_activation (str or keras activation function) The activation of the final layer of the model
- **size** (str (default 'small')) One of either 'small', 'medium', or 'large'
- **vocab_size** (str or None (default None)) Size of the vocab, if model_type is 'nlp_embedding'

Returns

model - The model

Return type

TensorFlow Keras model

1.1. aisquared 69

```
aisquared.utils.utils.mimic_model (trained_model: BaseEstimator, nnet: Model, training_data: ndarray, test_data: ndarray, test_labels: ndarray, problem_type: str, loss: str, metrics: str | list, optimizer: str, mimic_proba: bool = False, retention: float = 0.9, batch_size: int = 32, epochs: int = 100, starting_sparsification: int = 0, max_sparsification: int = 99, sparsification rate: int = 5) \rightarrow Model
```

Train a sparse neural network to mimic a scikit-learn model

Parameters

- **trained_model** (*sklearn model*) The model that is already trained
- nnet (TensorFlow keras Model) The neural network to train to mimic the trained model
- training_data (array or array-like) The input data that was used to train the trained model
- **test_data** (array or array-like) The input data to be used for testing
- test_labels (array or array-like) The output data used in testing
- **problem_type** (*str*) The type of problem, either 'classification' or 'regression'
- loss (str or keras loss function) The loss to use
- metrics (str, function or list of str, function) Metrics to measure
- optimizer (str or keras optimizer) The optimizer to use
- mimic_proba (bool (default False)) For classification, mimic the probability outputs
- **retention** (*float* (*default* 0.9)) The retention of performance to allow further pruning
- batch_size (int (default 32)) The batch size to use while training
- **epochs** (*int* (*default* 100)) The number of epochs (if early stopping is not met beforehand)
- starting_sparsification (int (default 0)) The starting model sparsification
- max_sparsification (int (default 99)) The maximum sparsification to allow
- **sparsification_rate** (*int* (*default* 5)) The sparsification rate when invoked

Returns

nnet – The trained model

Return type

TensorFlow keras Model

Module contents

Additional utilities to use with the *aisquared* package. These utilities currently consist of two functions, the *mimic_model* and *get_model* functions. They utilize functionality that exists in our open source package BeyondML to train teacher-student models

To see in-depth examples of how to use these functions, please visit our GitHub repository at https://github.com/AISquaredInc/MimicModelExamples

1.1.1.2 Module contents

This package contains utilities to interact with the AI Squared technology stack, particularly with developing and deploying models to the AI Squared Browser Extension or other applications developed through the AI Squared JavaScript SDK.

1.1. aisquared 71

TWO

CHANGELOG

• Version 0.1.3

- Added *flags* parameter to *TextHarvester* using regular expression harvesting
- Deleted model_feedback parameter in ModelConfiguration object and included functionality in feedback_steps parameter
- Changed format parameter to header for both deployed analytics
- Added feedback and stages to DocumentPredictor and ImagePredictor objects
- Non-API changes for ALLOWED_STAGES
- Fixed bugs preventing Windows users from importing the package
- Updated ModelConfiguration to include url parameter
- Changed default tokenization string

• Version 0.2.0

- Moved preprocessing steps under subpackages for specific kinds of preprocessing steps
- Cleaned up documentation to render within programmatic access environments
- Added aisquared.logging subpackage

- Created InputHarvester

- * Allows for harvesting of input text, images, and tabular data
- Created the aisquared.serving subpackage, specifically the deploy_model and get_remote_prediction functions
- Created the GraphConfiguration class
- Added auto-run parameter to ModelConfiguration and GraphConfiguration classes

- Created the aisquared CLI with the following commands:

- * aisquared deploy, which deploys a model locally
- * aisquared predict, which predicts using a local JSON file
- * aisquared airfiles, which contains the subcommands list, delete, download, and upload
- Changed all classes within aisquared.config.analytic to accept 'tabular' as an input type
- Removed aisquared.logging and aisquared.remote from top-level imports
- Added round parameter to Regression postprocesser
- Removed *DocumentPredictor* and *ImagePredictor* classes

- Removed *ChainRendering* class
- Created FilterRendering class
- Altered QUALIFIERS
- Added advanced rendering parameters to rendering objects
- Removed *logging* and *remote* subpackages from top-level *aisquared* import

Version 0.2.1

- Added the S3Connector class to the analytics subpackage, which allows download of an analytic directly from S3
- Updated the documentation and added the docs subdirectory for hosting the documentation on GitHub Pages

• Version 0.2.2

- Fixed bug in to_dict method within ObjectRendering class
- Fixed bug in name of MultiplyValue step
- Fixed bug in datatype checking for text harvester
- Added body_only parameter to TextHarvester
- Added 'underline' to possible badges
- Added threshold_key and threshold_values to relevant rendering classes
- Added *Trim* text preprocessing class
- Added CustomObject in the base package to allow for creation of custom classes
- Added keyword harvesting capabilities
- Added utils subpackage with capabilities to mimic a trained sklearn model
- Small documentation changes
- Changed the required imports for the package to streamline installation process, and created two installation options *aisquared* and *aisquared*[full]

• Version 0.2.3

- Added functionality to add custom preprocessing and postprocessing functions to the model deployment pipeline
- Added all parameter to LocalAnalytic class
- Changed under-the-hood functionality of mimic model function in line with updates to BeyondML
- Altered the ReverseMLWorkflow analytic
- Added the BarChartRendering, ContainerRendering, DashboardReplacementRendering, DoughnutChartRendering, HTMLTagRendering, LineChartRendering, PieChartRendering, SOSRendering, and TableRendering rendering classes
- Added the QueryParameterHarvester harvester class
- Added the *limit* parameter to the TextHarvester class

• Version 0.3.0

- Added type hinting to documentation strings
- Revamped documentation to use Sphinx

• Version 0.3.1

- Changed Python type hints to allow for backwards compatibility with older versions of Python

• Version 0.3.2

- Added functionality to the AISquaredPlatformClient
- Added top_level_kwargs parameter to the CustomObject class
- Added DashboardRendering class
- Removed 'px' from default values in ImageRendering and ObjectRendering classes
- Added functionality for creating, updating, and deleting users to AISquaredPlatformClient
- Added functionality for creating, updating, and delting groups to AISquaredPlatformClient
- Fixed bug related to requiring *auto_run* parameter to be string (fix involves casting as string)
- Altered schemas for different "Chart" Rendering classes to conform to JavaScript standards
- Streamlined the ModelConfiguration class to allow a more functional interface to build .air files
- Updated ContainerRendering class with parameters for position and static_position
- Updated across-the-board functionality of the AISquaredPlatformClient

• Version 0.3.3

- Updated functionality of the AISquaredPlatformClient to interact directly with the platform ALB
- Changed function names in support of change from MANN to BeyondML
- Added documentation surrounding global configuration objects
- Removed redundant additional dependencies

• Version 0.3.4

- Added support for custom CSS strings to appropriate rendering classes
- Refactored AISquaredPlatformClient to import functions from support files
- Fixed documentation errors for the documentation site
- Checked whether responses returned OK status code rather than 200
- Moved CustomObject to aisquared.config from aisquared.base
- Changed endpoint used to list platform users
- Fixed response behaviors where no data was returned from AISquaredPlatformClient

Version 0.3.5

- Changed file_name parameter in ReverseMLWorkflow to file_names
- Added documentation_link parameter to ModelConfiguration class

• Version 0.3.6

- Fixed issue with type checking for *ModelConfiguration* Rendering classes
- Restricted TensorFlow version to below 2.12.0 to prevent import issues
- Added position parameter to WordRendering class
- Changed default CSS styling for rendering classes
- Changed name of all *processor* classes to *processer*

• Version 0.3.7

- Changed schema of the DeployedAnalytic class to include API key management
- Changed JSON schema of Preprocesser classes
- Allowed .keras files to be saved and loaded with the ModelConfiguration and GraphConfiguration
 APIs into .air files
- Relaxed TensorFlow requirements enforced in version 0.3.6

• Version 0.3.8

- Created ChatbotHarvester class
- Created TextRendering class
- Changed location of reference lists of classes to clean up code
- Updated class schemas to ensure compliance with expectations
- Updated test cases

• Version 0.3.9

- Created CustomRendering class
- Changed to full import of CustomObject in aisquared.base subpackage

• Version 0.3.10

- Added *DatabricksClient* to the *aisquared.platform* subpackage

• Version 0.3.11

- Updated DeployedModel class configuration to conform to AIRJS
- Updated DatabricksClient class to include update_job function
- Updated custom CSS fields in rendering classes
- Reconfigured ReverseMLWorkflow class
- Added 'User-Agent' to headers for AISquaredPlatformClient and DatabricksClient
- Added *llmlink* as a dependency to the 'full' installation of *aisquared* and added it as a top-level package

• Version 0.3.12

- Updated *DeployedModel* class to support more abstract API calls
- Updated ChatbotHarvester, DeployedAnalytic, and ChatRendering classes
- Updated *ModelConfiguration* class with *warnings* and *documentURL*
