CHAPTER

ONE

INSTALLATION

This package is available through Pypi and can be installed by running the following command:

pip install aisquared

Alternatively, the latest version of the software can be installed directly from GitHub using the following command:

pip install git+https://github.com/AISquaredInc/aisquared

1.1 aisquared

1.1.1 aisquared package

1.1.1.1 Module contents

This package contains utilities to interact with the AI Squared technology stack, particularly with developing and deploying models to the AI Squared Browser Extension or other applications developed through the AI Squared JavaScript SDK.

1.1.1.2 Subpackages

aisquared.base package

Module contents

The aisquared base package contains both some basic objects that are used across the aisquared package backend and some objects which are designed to facilitate simple use cases of the technology.

Submodules

aisquared.base.BaseObject module

class aisquared.base.BaseObject.BaseObject

Bases: object

Base class used for all other classes within the aisquared package. This class is not meant to be used by any end user of this package, but is rather used throughout this package as a parent class.

```
to_dict() → dict
Get the object as a dictionary
to_json() → str
Return the object as a json string
```

aisquared.base.CustomObject module

```
class aisquared.base.CustomObject.CustomObject(class_name: str, **kwargs)
```

Bases: BaseObject

Custom class that allows the user to define custom classes for configuration

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.base.CustomObject(
    'MyClass',
    key1 = 'foo',
    key2 = 'bar'
    )
>>> my_obj.to_dict()
{'className': 'MyClass', 'params': {'key1': 'foo', 'key2': 'bar'}}
)
```

```
\textbf{to\_dict()} \rightarrow dict
```

Get the object as a dictionary

aisquared.base.rendering module

Some allowed configuration parameters - not meant to be directly called by the end user

aisquared.base.stages module

Some allowed configuration parameters - not designed to be directly called by the user

aisquared.config package

Module contents

The aisquared.config subpackage contains utilities and objects for packaging aisquared configuration steps and models.

For in-depth examples of how to build out .air files using the utilities and classes in this library, please visit our GitHub repository at https://github.com/AISquaredInc/airFiles

Subpackages

aisquared.config.analytic package

Module contents

The aisquared.config.analytic subpackage contains objects for packaging individual analytics.

Submodules

aisquared.config.analytic.DeployedAnalytic module

Bases: BaseObject

Interaction with a remote analytic

Example usage:

```
>>> import aisquared
>>> analytic = aisquared.config.analytic.DeployedAnalytic(
    'analytic_url',
    'text'
)
>>> analytic.to_dict()
{'className': 'DeployedAnalytic',
'params': {'url': 'analytic_url',
'inputType': 'text',
'secret': 'request',
'header': None}}
```

```
property header
property input_type
property secret
to_dict() → dict
    Get the object as a dictionary
property url
```

aisquared.config.analytic.DeployedModel module

Bases: BaseObject

Interaction with a remote model

Example usage:

```
property header
property input_type
property secret
to_dict() → dict
    Get the config object as a dictionary
property url
```

aisquared.config.analytic.LocalAnalytic module

Bases: BaseObject

Interaction with an analytic (lookup table) saved to the local file system

Example usage:

(continues on next page)

```
property all
     property input_type
     property path
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
aisquared.config.analytic.LocalModel module
class aisquared.config.analytic.LocalModel.LocalModel(path: str, input_type: str)
     Bases: BaseObject
     Interaction with a model currently saved to the local file system
     Example usage:
     >>> import aisquared
     >>> analytic = aisquared.config.analytic.LocalModel(
          'model_path',
          'text'
     >>> analytic.to_dict()
     {'className': 'LocalModel',
     'params': {'path': 'model_path',
     'inputType': 'text'}}
     property input_type
     property path
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
aisquared.config.analytic.ReverseMLWorkflow module
class aisquared.config.analytic.ReverseMLWorkflow.ReverseMLWorkflow(bucket: str, filename: str,
                                                                             column: str, input_type:
                                                                             str, period: Optional[int] =
                                                                             None, secret: str = ")
     Bases: BaseObject
     Interaction with a ReverseML CSV stored in S3
     Example usage:
     >>> import aisquared
     >>> analytic = aisquared.config.analytic.ReverseMLWorkflow(
          'bucket_name',
          'file_name',
          'column_name',
```

1.1. aisquared 7

'text'

)

(continued from previous page)

```
>>> analytic.to_dict()
{'className': 'ReverseMLWorkflow',
'params': {'bucket': 'bucket_name',
'fileName': 'file_name',
'inputType': 'text',
'column': 'column_name',
'period': None,
'secret': ''}}
```

```
property bucket

property column

property filename

property input_type

property period

property secret

to_dict() → dict

Get the configuration object as a dictionary
```

aisquared.config.feedback package

Module contents

The aisquared.config.feedback subpackage contains objects for configuring feedback in aisquared models.

Submodules

aisquared.config.feedback.BinaryFeedback module

```
{\bf class} \ a is quared. config. feedback. Binary Feedback. {\bf Binary Feedback} ({\it label\_map: list}) \\ Bases: {\it BaseObject}
```

Example usage:

Feedback for binary classification

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.BinaryFeedback(['class1', 'class2'])
>>> my_obj.to_dict()
{'className': 'BinaryFeedback', 'params': {'labelMap': ['class1', 'class2']}}
```

```
property label_map

to_dict() \rightarrow dict

Return the object as a dictionary
```

aisquared.config.feedback.ModelFeedback module

class aisquared.config.feedback.ModelFeedback

Bases: BaseObject

Feedback object for questions and answers for an individual model.

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.ModelFeedback()
>>> my_obj.add_question(
    'How is the model performing?',
    choices = ['very poorly', 'poorly', 'neutral', 'well', 'very well']
>>> my_obj.add_question(
    'Any additional feedback?',
    'text'
>>> my_obj.to_dict()
{'className': 'ModelFeedback',
'params': {'questions': [{'question': 'How is the model performing?',
'answerType': 'singleChoice',
'choices': ['very poorly', 'poorly', 'neutral', 'well', 'very well']},
{'question': 'Any additional feedback?', 'answerType': 'text'}]}}
```

 $add_question(question: str, answer type: str = 'singleChoice', choices: list = [])$

Add a question to be asked.

Parameters

- **question** (*str*) The question to be asked.
- answer_type (str (default 'singleChoice')) One of either 'singleChoice', 'multiChoice', or 'text'
- **choices** (list (default [])) The choices to be provided, if answer_type is 'single-Choice' or 'multiChoice'

```
to_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.MulticlassFeedback module

class aisquared.config.feedback.MulticlassFeedback.MulticlassFeedback(label_map: list)

Bases: BaseObject

Feedback for multiclass classification

Example Usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.MulticlassFeedback(['class1', 'class2',
>>> my_obj.to_dict()
```

1.1. aisquared 9

(continues on next page)

(continued from previous page)

```
{'className': 'MulticlassFeedback',
'params': {'labelMap': ['class1', 'class2', 'class3']}}
```

property label_map

```
to_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.QualitativeFeedback module

${\bf class} \ {\bf aisquared.config.feedback.Qualitative Feedback.Qualitative Feedback}$

Bases: BaseObject

Feedback object for questions and answers for individual predictions.

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.QualitativeFeedback()
>>> my_obj.add_question('Any additional feedback?', 'text')
>>> my_obj.to_dict()
{'className': 'QualitativeFeedback',
'params': {'questions': [{'question': 'Any additional feedback?',
'answerType': 'text'}]}}
```

add_question(question: str, answer_type: str = 'singleChoice', choices: list = [])

Add a question to be asked.

Parameters

- **question** (*str*) The question to be asked.
- answer_type (str (default 'singleChoice')) One of either 'singleChoice', 'multiChoice', or 'text'
- **choices** (*list* (*default* [])) The choices to be provided, if *answer_type* is 'single-Choice' or 'multiChoice'

```
\textbf{to\_dict()} \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.RegressionFeedback module

class aisquared.config.feedback.RegressionFeedback.RegressionFeedback

```
Bases: BaseObject
```

Feedback for regression

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.RegressionFeedback()
>>> my_obj.to_dict()
{'className': 'RegressionFeedback', 'params': {}}
```

```
to\_dict() \rightarrow dict
```

Return the object as a dictionary

aisquared.config.feedback.SimpleFeedback module

class aisquared.config.feedback.SimpleFeedback

```
Bases: BaseObject
```

Simple thumbs-up/thumbs-down feedback for predictions

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.feedback.SimpleFeedback()
>>> my_obj.to_dict()
{'className': 'SimpleFeedback', 'params': {}}
```

```
\textbf{to\_dict()} \rightarrow dict
```

Return the object as a dictionary

aisquared.config.harvesting package

Module contents

The aisquared.config.harvesting subpackage contains objects for configuring harvesting of data.

Submodules

aisquared.config.harvesting.lmageHarvester module

```
class aisquared.config.harvesting.ImageHarvester.ImageHarvester(how: str = 'all')
```

```
Bases: BaseObject
```

Object to harvest images

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.ImageHarvester()
>>> my_obj.to_dict()
{'className': 'ImageHarvester', 'params': {'how' : 'all'}}
```

property how

```
\textbf{to\_dict()} \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.harvesting.InputHarvester module

aisquared.config.harvesting.QueryParameterHarvester module

Get the configuration object as a dictionary

class aisquared.config.harvesting.QueryParameterHarvester.QueryParameterHarvester(query_keys:

Union[str, list], url_locations: Union[str, list], attributes: Union[str, list])

Bases: BaseObject

 $to_dict() \rightarrow dict$

Harvester for Query Parameters

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.harvesting.QueryParameterHarvester(
    'test_key',
    'test_url',
    'test_attribute'
)
>>> my_obj.to_dict()
{'className': 'QueryParameterHarvester',
'params': {'queryKeys': ['test_key'],
'urlLocations': ['test_url'],
'attributes': ['test_attribute']}}
```

```
property attributes
     property query_keys
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property url_locations
aisquared.config.harvesting.TextHarvester module
class aisquared.config.harvesting.TextHarvester.TextHarvester(how: str = 'all', regex:
                                                                       Optional[str] = None, flags: str =
                                                                       'gu', body\_only: bool = False,
                                                                       keywords: Optional[Union[str,
                                                                       list]] = None, limit: Optional[int]
                                                                       = None)
     Bases: BaseObject
     Object to harvest text
     Example usage:
     >>> import aisquared
     >>> my_obj = aisquared.config.harvesting.TextHarvester(
         how = 'all',
         body_only = True
     >>> my_obj.to_dict()
     {'className': 'TextHarvester',
     'params': {'how': 'all',
     'regex': None,
     'flags': 'gu',
     'bodyOnly': True,
     'limit': None}}
     property body_only
     property flags
     property how
     property limit
     property regex
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
```

aisquared.config.postprocessing package

Module contents

The aisquared.config.postprocessing subpackage contains objects for configuring how predictions are postprocessed.

Submodules

aisquared.config.postprocessing.BinaryClassification module

class aisquared.config.postprocessing.BinaryClassification.BinaryClassification(label_map: list, threshold: float = 0.5)

Bases: BaseObject

Postprocesssing configuration object for binary classification

Example usage

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.BinaryClassification(
    ['class1', 'class2']
)
>>> my_obj.to_dict()
{'className': 'BinaryClassification',
'params': {'labelMap': ['class1', 'class2'], 'threshold': 0.5}}
```

```
property label_map
```

property threshold

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.postprocessing.MulticlassClassification module

Bases: BaseObject

Postprocessing configuration object for multiclass classification

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.MulticlassClassification(
    ['class1', 'class2', 'class3']
)
>>> my_obj.to_dict()
{'className': 'MulticlassClassification',
    'params': {'labelMap': ['class1', 'class2', 'class3']}}
```

```
property label_map  \begin{tabular}{ll} to\_dict() \rightarrow dict \\ Get the configuration object as a dictionary \\ \end{tabular}
```

aisquared.config.postprocessing.ObjectDetection module

class aisquared.config.postprocessing.ObjectDetection.ObjectDetection($label_map: list, threshold: float = 0.5$)

Bases: BaseObject

Postprocessing configuration object for object detection

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.ObjectDetection(
    ['class1', 'class2', 'class3']
)
>>> my_obj.to_dict()
{'className': 'ObjectDetection',
    'params': {'labelMap': ['class1', 'class2', 'class3'], 'threshold': 0.5}}
```

```
property label_map
```

property threshold

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.postprocessing.Regression module

```
 \textbf{class} \  \, \text{aisquared.config.postprocessing.Regression.Regression}(\textit{min: Optional[Union[int, float]]} = \\ \textit{None, max: Optional[Union[int, float]]} = \\ \textit{None, max: Optional[Union[int, float]]} = \\ \textit{None, round: bool} = \textit{False})
```

Bases: BaseObject

Postprocessing configuration object for Regression

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.postprocessing.Regression(
        10,
        100
)
>>> my_obj.to_dict()
{'className': 'Regression', 'params': {'min': 10, 'max': 100, 'round': False}}
```

property max
property min
property round

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.preprocessing package

Module contents

The aisquared.config.preprocessing subpackage contains utilities to configure the preprocessing of data in the data pipeline. It contains

three separate subpackages, aisquared.config.preprocessing.text, aisquared.config.preprocessing.image, and aisquared.config.preprocessing.tabular, which configure the preprocessing of different types of data.

Subpackages

aisquared.config.preprocessing.image package

Module contents

The aisquared.config.preprocessing.image subpackage contains objects for configuring image preprocessing.

Submodules

aisquared.config.preprocessing.image.lmagePreprocessing module

Bases: BaseObject

Preprocessor object for image data

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.image.AddValue(255.0)
)
```

```
add_step(step)
```

Add a step to the preprocessor object

```
property step_dict
```

```
to_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.preprocessing.image.Steps module

```
class aisquared.config.preprocessing.image.Steps.AddValue(value: Union[int, float])
     Bases: BaseObject
     Preprocessing step to add a value to all pixels in an image
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.AddValue(255.0)
     )
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
class aisquared.config.preprocessing.image.Steps.ConvertToColor(color: str)
     Bases: BaseObject
     Preprocessing step to convert images to a color scheme
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.ConvertToColor('RGB')
     )
     property color
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.image.Steps.DivideValue(value: Union[int, float])
     Bases: BaseObject
     Preprocessing step to divide all pixels in an image by a value
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.DivideValue(255.0)
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
```

```
class aisquared.config.preprocessing.image.Steps.MultiplyValue(value: Union[int, float])
     Bases: BaseObject
     Preprocessing step to multiply all pixels in an image by a value
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.MultiplyValue(2.0)
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
class aisquared.config.preprocessing.image.Steps.Resize(size: list, method: str = 'bilinear',
                                                               preserve_aspect_ratio: bool = False)
     Bases: BaseObject
     Preprocessing step to resize an image
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.Resize([100, 100])
     property method
     property preserve_aspect_ratio
     property size
     \textbf{to\_dict()} \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.image.Steps.SubtractValue(value: Union[int, float])
     Bases: BaseObject
     Preprocessing step to subtract a value from all pixels in an image
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.image.ImagePreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.image.SubtractValue(255.0)
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property value
```

aisquared.config.preprocessing.tabular package

Module contents

The aisquared.config.preprocessing.tabular subpackage contains objects for preprocessing tabular data.

Submodules

aisquared.config.preprocessing.tabular.Steps module

```
class aisquared.config.preprocessing.tabular.Steps.DropColumn(column: int)
    Bases: BaseObject
```

Drop a column from tabular data

Example usage:

property column

```
to_dict() \rightarrow dict
```

Get the configuration object as a dictionary

class aisquared.config.preprocessing.tabular.Steps.MinMax(mins: list, maxs: list, columns: Optional[list] = None)

Bases: BaseObject

Min-Max Scaling preprocessing step

Min-Max Scaling takes all associated columns and maps values relative to the minimum and maximum values of the training data.

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocessor()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.tabular.MinMax(
        [0, 1.1, 2],
        [0.2, 14, 18.3]
    )
)
```

property columns

property maxs

```
property mins
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.tabular.Steps.OneHot(column: int, values: list)
     Bases: BaseObject
     One Hot encoding preprocessing step
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocessor()
     >>> preprocesser.add_step(
          aisquared.config.preprocessing.tabular.OneHot(
              ['one', 'two', 'three']
          )
     )
     property column
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property values
class aisquared.config.preprocessing.tabular.Steps.ZScore(means: list, stds: list, columns:
                                                                  Optional[Union[int, list]] = None
     Bases: BaseObject
     Z-Score normalization preprocessing step
     Z-Score normalization takes each supplied column value, subtracts that column's provided mean, and divides by
     the provided standard deviation.
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocessor()
     >>> preprocesser.add_step(
          aisquared.config.preprocessing.tabular.ZScore(
              [0, 1, 2],
              [0.2, 0.4, 0.6]
          )
     )
     property columns
     property means
     property stds
     to_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.preprocessing.tabular.TabularPreprocessing module

 $\textbf{class} \ \, \textbf{aisquared.config.preprocessing.tabular.TabularPreprocessing.TabularPreprocessor} (\textit{steps:} \\$

Optional[list]
=
None)

Bases: BaseObject

Preprocessor object for tabular data

Example usage:

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.tabular.TabularPreprocessor()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.tabular.ZScore(
        [0, 1, 2],
        [0.2, 0.4, 0.6]
    )
)
```

add_step(step)

Add a step to the preprocessor object

to_dict()

Get the configuration object as a dictionary

aisquared.config.preprocessing.text package

Module contents

The aisquared.config.preprocessing.text subpackage contains objects for preprocessing text data.

Submodules

aisquared.config.preprocessing.text.Steps module

class aisquared.config.preprocessing.text.Steps.ConvertToCase(lowercase: bool = True)

Bases: BaseObject

Text preprocessing object to convert inputs to all lowercase or all uppercase

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.text.ConvertToCase()
)
```

```
property lowercase
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
class aisquared.config.preprocessing.text.Steps.ConvertToVocabulary(vocabulary: dict,
                                                                             start character: int = 1,
                                                                             oov\_character: int = 2,
                                                                             max_vocab: Optional[int]
                                                                             = None)
     Bases: BaseObject
     Text preprocessing object to convert tokens to integer vocabularies
     Example usage:
     >>> import aisquared
     >>> preprocesser = aisquared.config.preprocessing.text.TextPreprocessor()
     >>> preprocesser.add_step(
         aisquared.config.preprocessing.text.ConvertToVocabulary(
              {
                   'test' : 3,
                   'vocabulary': 4
              }
         )
     property max_vocab
     property oov_character
     property start_character
     to_dict() \rightarrow dict

     property split_sentences
     property split_words
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
     property token_pattern
class aisquared.config.preprocessing.text.Steps.Trim
     Bases: BaseObject
     Text preprocessing class to trim whitespace from text
     Example usage:
```

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.text.Trim()
)
```

```
to_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.preprocessing.text.TextPreprocessing module

Bases: BaseObject

Preprocessor object for natural language

Example usage:

```
>>> import aisquared
>>> preprocesser = aisquared.config.preprocessing.text.TextPreprocessor()
>>> preprocesser.add_step(
    aisquared.config.preprocessing.text.Tokenize()
)
```

add_step(step)

Add a step to the preprocessor object

```
property step_dict
```

```
to\_dict() \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.rendering package

Module contents

The aisquared.config.rendering subpackage contains objects for configuring how rendering of predictions is to occur.

Submodules

aisquared.config.rendering.BarChartRendering module

str = '0'

Bases: BaseObject

Rendering class for rendering a Bar Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.BarChartRendering(
    'my bar chart',
    'barChart1Label',
    'MyBarChart',
    ['red', 'blue'],
    ['label1', 'label2'],
    'my_container',
    'key',
    'value',
    'name'
>>> my_obj.to_dict()
{'className': 'BarChartRendering',
'label': 'my bar chart',
'params': {'id': 'barChart1Label',
'chartName': 'MyBarChart',
'chartColors': ['red', 'blue'],
'chartLabels': ['label1', 'label2'],
'containerId': 'my_container',
'predictionNameKey': 'key',
'predictionValueKey': 'value',
'predictionNameValue': 'name',
'width': 'auto',
'height': 'auto',
'xOffset': '0',
'yOffset': '0'}}
```

$to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.ContainerRendering module

```
class aisquared.config.rendering.ContainerRendering.ContainerRendering(label: str, id: str,
                                                                                query_selector: str,
                                                                                width: str = 'auto',
                                                                                height: str = 'auto',
                                                                                display: str = 'flex',
                                                                               xOffset: str = '0',
                                                                               yOffset: str = '0',
                                                                               position: str = ",
                                                                                orientation: str =
                                                                                'column')
     Bases: BaseObject
     Rendering for a container
     Example usage:
     >>> import aisquared
     >>> my_obj = aisquared.config.rendering.ContainerRendering(
          'my container',
          'myContainerID',
         "[data-id='tabpanel-general']"
     >>> my_obj.to_dict()
     {'className': 'ContainerRendering',
     'label': 'my container',
     'params': {'id': 'myContainerID',
     'width': 'auto',
     'height': 'auto',
     'display': 'flex',
     'xOffset': '0',
     'yOffset': '0',
     'position': ''
     'orientation': 'column',

     property display
     property height
     property id
     property label
     property orientation
     property position
     property query_selector
     to_dict() \rightarrow dict
          Get the configuration object as a dictionary
```

property width

```
property xOffset
property yOffset
```

aisquared.config.rendering.DashboardReplacementRendering module

 $\textbf{class} \ \ \textbf{aisquared.config.rendering.DashboardReplacementRe$

str,
where_replace
str
=
",
label:
str
=
"')

Bases: BaseObject

Rendering for dashboard replacement

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.DashboardReplacementRendering(
    'test_anchor_selector'
)
>>> my_obj.to_dict()
{'className': 'DashboardReplacementRendering',
    'label': '',
    'params': {'anchorSelector': 'test_anchor_selector', 'whereReplace': ''}}
```

```
property anchor_selector
property label
to_dict() → dict
    Get the configuration object as a dictionary
property where_replace
```

aisquared.config.rendering.DocumentRendering module

```
class aisquared.config.rendering.DocumentRendering.DocumentRendering(prediction_key: str =
```

'className', words: Optional[Union[list, dict, str]] = None, documents: Optional[Union[list, dict, str]] = None,include probability: bool = False, probability_key: str = 'probability', $underline_color: str =$ 'blue', classes: Optional[list] = None,threshold_key: Optional[str] = None,threshold_value: Optional[Union[int, float]] = None

Bases: BaseObject

Object which dictates how to render predictions on entire documents

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.DocumentRendering()
>>> my_obj.to_dict()
{'className': 'DocumentRendering',
'params': {'predictionKey': 'className',
'words': None,
'documents': None,
'includeProbability': False,
'probabilityKey': 'probability',
'underlineColor': 'blue',
'classes': None,
'thresholdKey': None,
'thresholdValue': None}}
```

```
property classes

property documents

property include_probability

property prediction_key

property probability_key

property threshold_key

property threshold_value

to_dict() → dict

Get the configuration object as a dictionary

property underline_color

property words
```

aisquared.config.rendering.DoughnutChartRendering module

class aisquared.config.rendering.DoughnutChartRendering.DoughnutChartRendering(label: str, id:

```
chart_name:
str,
chart_colors:
list,
chart_labels:
list,
container_id:
str, predic-
tion name key:
str, predic-
tion_value_key:
str, predic-
tion_name_value:
str, dis-
play_legend:
bool,
legend_icon:
str, width: str
= 'auto',
height: str =
'auto',
xOffset: str =
'0', yOffset:
str = '0'
```

Bases: BaseObject

Rendering class for rendering a Doughnut Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.DoughnutChartRendering(
    'my doughnut chart',
    'MyDoughnutChartID',
    'MyDoughnutChart',
    ['red', 'blue'],
    ['label1', 'label2'],
    'my_countainer_id',
    'key',
    'value',
    'name',
    True,
    'circle'
>>> my_obj.to_dict()
{'className': 'DoughnutChartRendering',
'label': 'my doughnut chart',
'params': {'id': 'MyDoughnutChartID',
'chartName': 'MyDoughnutChart',
'chartColors': ['red', 'blue'],
                                                                          (continues on next page)
```

(continued from previous page)

```
'chartLabels': ['label1', 'label2'],
'containerId': 'my_countainer_id',
'predictionNameKey': 'key',
'predictionValueKey': 'value',
'predictionNameValue': 'name',
'displayLegend': True,
'legendIcon': 'circle',
'width': 'auto',
'height': 'auto',
'xOffset': '0',
'yOffset': '0'}}
```

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.FilterRendering module

Bases: BaseObject

Object which dictates how predictions are to be passed to downstream analytics

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.FilterRendering(
    'inputs',
    'key',
    'gt',
    0.2
)
>>> my_obj.to_dict()
{'className': 'FilterRendering',
    'params': {'source': 'inputs', 'key': 'key', 'qualifier': 'gt', 'value': 0.2}}
```

```
property key
```

```
property qualifier
```

property source

 $to_dict() \rightarrow dict$

Get the configuration object as a dictionary

property value

aisquared.config.rendering.HTMLTagRendering module

Bases: BaseObject

Rendering for HTML tags

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.HTMLTagRendering(
    'my HTML tag',
    'MyHTMLTagRenderingID',
    'MyContainerID',
    'Example Text',
    'extra_tag',
    'append',
    'name_key',
    'value_key',
    'name_value'
>>> my_obj.to_dict()
{'className': 'HTMLTagRendering',
'label': 'my HTML tag',
'params': {'id': 'MyHTMLTagRenderingID',
'containerId': 'MyContainerID',
'htmlContent': 'Example Text',
'extraContentTag': 'extra_tag',
'injectionAction': 'append',
'predictionNameKey': 'name_key',
'predictionValueKey': 'value_key',
'predictionNameValue': 'name_value',
'content': ''}}
```

 $to_dict() \rightarrow dict$

Return the configuration object as a dictionary

aisquared.config.rendering.lmageRendering module

Object which dictates how to render images

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.ImageRendering()
>>> my_obj.to_dict()
{'className': 'ImageRendering',
'params': {'color': 'blue',
'thickness': '5px',
'placement': 'bottomleft',
'includeProbability': False,
'badgeColor': 'white',
'fontColor': 'black',
'fontSize': '5px',
'classes': None,
'thresholdKey': None,
'thresholdValue': None}}
```

```
property badge_color

property classes

property color

property font_color

property font_size

property include_probability

property placement

property thickness

property threshold_key

property threshold_value

to_dict() → dict

Get the configuration object as a dictionary
```

aisquared.config.rendering.LineChartRendering module

Bases: BaseObject

Rendering class for rendering a Line Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.LineChartRendering(
    'my line chart',
    'MyLineChartID',
    'MyLineChart',
    ['red', 'blue'],
    ['label1', 'label2'],
    'MyContainerID',
    'name_key',
    'value_key'.
    'name_value'
>>> my_obj.to_dict()
{'className': 'LineChartRendering',
'label': 'my line chart',
'params': {'id': 'MyLineChartID',
'chartName': 'MyLineChart',
'chartColors': ['red', 'blue'],
'chartLabels': ['label1', 'label2'],
'containerId': 'MyContainerID',
'predictionNameKey': 'name_key',
'predictionValueKey': 'value_key',
'predictionNameValue': 'name_value',
'width': 'auto',
'height': 'auto',
'xOffset': '0',
'yOffset': '0'}}
```

$\textbf{to_dict()} \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.ObjectRendering module

```
class aisquared.config.rendering.ObjectRendering.ObjectRendering(color: str = 'blue', thickness:
                                                                         str = '5px', placement: str =
                                                                         'bottomleft',
                                                                         include_probability: bool =
                                                                         False, badge\_color: str =
                                                                         'white', font color: str = 'black',
                                                                         font\_size: str = '5px')
     Bases: BaseObject
     Object which dictates how to render object detection in images
     Example usage:
     >>> import aisquared
     >>> my_obj = aisquared.config.rendering.ObjectRendering()
     >>> my_obj.to_dict()
     {'className': 'ObjectRendering',
     'params': {'color': 'blue',
     'thickness': '5px',
     'placement': 'bottomleft',
     'includeProbability': False,
     'badgeColor': 'white',
     'fontColor': 'black',
     'fontSize': '5px'}}
     property badge_color
     property color
     property font_color
     property font_size
     property include_probability
     property placement
     property thickness
     to\_dict() \rightarrow dict
```

aisquared.config.rendering.PieChartRendering module

Get the configuration object as a dictionary

Bases: BaseObject

Rendering class for rendering a Pie Chart

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.PieChartRendering(
    'my pie chart',
    'MyPieChartID',
    'MyPieChart',
    ['red', 'blue'],
    ['label1', 'label2'],
    'my_countainer_id',
    'key',
    'value',
    'name',
    True,
    'circle'
)
>>> my_obj.to_dict()
{'className': 'PieChartRendering',
'label': 'my pie chart',
'params': {'id': 'MyPieChartID',
'chartName': 'MyPieChart',
'chartColors': ['red', 'blue'],
'chartLabels': ['label1', 'label2'],
'containerId': 'my_countainer_id',
'predictionNameKey': 'key',
'predictionValueKey': 'value',
'predictionNameValue': 'name',
'displayLegend': True,
'legendIcon': 'circle',
'width': 'auto',
'height': 'auto',
'x0ffset': '0',
'yOffset': '0'}}
```

$to_dict() \rightarrow dict$

Get the configuration object as a dictionary

aisquared.config.rendering.SOSRendering module

```
class aisquared.config.rendering.SOSRendering.SOSRendering(can_toggle: bool, label: str = ")
    Bases: BaseObject
    Rendering of an SOS dashboard
    Example usage:

>>> import aisquared
>>> my_obj = aisquared.config.rendering.SOSRendering(True)
>>> my_obj.to_dict()
{'className': 'SOSRendering', 'label': '', 'params': {'canToggle': True}}

property can_toggle

property label
to_dict() → dict
```

aisquared.config.rendering.TableRendering module

Get the configuration object as a dictionary

Bases: BaseObject

Class for rendering tables

Example usage:

```
>>> import aisquared
>>> my_obj = aisquared.config.rendering.TableRendering(
    'my table',
    'MyTableID',
    'MyContainerID',
    'name_key',
    'value_key'
    'name_values'
>>> my_obj.to_dict()
{'className': 'TableRendering',
'label': 'my table',
'params': {'id': 'MyTableID',
'containerId': 'MyContainerID'
'predictionNameKey': 'name_key',
'predictionValueKey': 'value_key',
'predictionNameValues': 'name_values',
'tableName': ''}}
```

```
\textbf{to\_dict()} \rightarrow dict
```

Get the configuration object as a dictionary

aisquared.config.rendering.WordRendering module

property word_list

```
class aisquared.config.rendering.WordRendering.WordRendering(word_list: str = 'input', result_key:
                                                                     Optional[str] = None, content\_key:
                                                                     Optional[str] = None, badge\_shape:
                                                                     str = 'star', badge\_color: str = 'blue',
                                                                     classes: Optional[list] = None,
                                                                     threshold key: Optional[str] =
                                                                     None, threshold_value:
                                                                     Optional[Union[int, float]] = None
     Bases: BaseObject
     Object for rendering badges on individual words
     Example usage:
     >>> import aisquared
     >>> my_obj = aisquared.config.rendering.WordRendering()
     >>> my_obj.to_dict()
     {'className': 'WordRendering',
     'params': {'wordList': 'input',
     'resultKey': None,
     'contentKey': None,
     'badgeShape': 'star',
     'badgeColor': 'blue',
     'classes': None,
     'thresholdKey': None,
     'thresholdValue': None}}
     property badge_color
     property badge_shape
     property classes
     property content_key
     property result_key
     property threshold_key
     property threshold_value
     to\_dict() \rightarrow dict
          Get the configuration object as a dictionary
```

Submodules

aisquared.config.GraphConfiguration module

```
class aisquared.config.GraphConfiguration.GraphConfiguration(name: str, stage: str = 'experimental', version:

Optional[int] = None, description:

str = ", mlflow\_uri: Optional[str] = None, mlflow\_user: Optional[str] = None, mlflow\_token: Optional[str] = None, owner: Optional[str] = None, owner: Optional[str] = owner: owner
```

Bases: BaseObject

Configuration object for deploying a set of processing steps and/or analytics as a dependency graph

```
add_node(step: BaseObject, dependencies: Optional[Union[int, list]] = None) \rightarrow int Add a node to the configuration graph
```

Parameters

- **step** (aisquared configuration step) The step to add
- dependencies (int, list of int, or None) The ids of nodes which must be run before the added node

Returns

node_id - The integer id of the node that is added

Return type

int

property auto_run

```
compile(filename: Optional[str] = None, dtype: Optional[str] = None) <math>\rightarrow None
```

Compile the object into a '.air' file, which can then be dragged and dropped into applications using the AI Squared JavaScript SDK

Parameters

- **filename** (path-like or None (default None)) Filename to compile to. If None, defaults to '{NAME}.air', where {NAME} is the name of the analytic
- **dtype** (*str or None* (*default None*)) The datatype to use for the model weights when using a Keras model. If None, defaults to 'float32'

```
property description
```

```
get_filenames() \rightarrow list
```

Get filenames for all models in the configuration

```
property mlflow_token
property mlflow_uri
property mlflow_user
property name
```

```
property owner
property stage
to_dict() → dict
    Get the object as a dictionary

aisquared.logging package

Module contents

The aisquared.logging subpackage contains utilities for performing experiments within aisquared.

This functionality is inhereted from MLFlow. Please see the MFLow documentatation at https://mlflow.org.

aisquared.platform package

Module contents

Utilities for interacting with the AI Squared Platform.

The primary class within this subpackage is the *AISquaredPlatformClient* class, which has the capabilities to interact with much of the functionality in the AI Squared platform. For more information about this class, please see its documentation.

Submodules

aisquared.platform.AISquaredPlatformClient module

```
\begin{tabular}{ll} \textbf{exception} & a is quared. platform. AIS quared Platform Client. \textbf{AIS quared APIException} \\ Bases: & \textbf{Exception} \\ \end{tabular}
```

class aisquared.platform.AISquaredPlatformClient.AISquaredPlatformClient

Bases: object

Client for interacting with the AI Squared platform programmatically

When using the client for the first time, it is important to run the *client.login()* method. When doing so, the client will ask for any required information interactively.

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> # If you have never logged in before, run the following code:
>>> client.login()
>>> # Test connection
>>> client.test_connection()
Connection successful
200
```

```
add_user_to_group(group_id, user_id)
```

Not yet implemented

property base_url: str

The base URL associated with the client

```
delete\_model(id: str, port: int = 8080) \rightarrow bool
```

Delete a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.delete_model('model_id')
True
```

Parameters

- id (str) The ID for the model
- $port \ (\textit{int} \ (\textit{default 8080})) The \ API \ port \ for \ the \ model$

Returns

success - Whether the action was successful

Return type

bool

```
get_model(id: str, port: int = 8080) \rightarrow dict
```

Retrieve a model configuration

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
```

(continues on next page)

(continued from previous page)

```
>>> client.get_model('model_id')
*JSON Response including model data and metadata*
```

Parameters

- id (str) The ID for the model
- port (int (default 8080)) The API port for the call

Returns

data – Metadata about the model coupled with the model's configuration information

Return type

dictionary

$get_model_id_by_name(model_name: str) \rightarrow str$

Retrieve a model's ID using the name of the model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_model_id_by_name('my_awesome_model')
*model_id*
```

Parameters

model_name (str) – The name of the model

Returns

model_id – The model's ID

Return type

str

$get_user_id_by_name(name: str) \rightarrow str$

Get a user's ID from their display name

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.get_user_id_by_name('User Name')
*user_id*
```

Parameters

 $\mathbf{name} \ (\mathbf{str})$ – The display name of the user

Returns

id – The ID of the user

Return type

str

get_user_usage_metrics(user_id, port=8080)

Not yet implemented

property headers

Headers used for authentication with the AI Squared Platform

```
list_group_users(group\_id: str, as\_df: bool = True, port: int = 8083) \rightarrow Union[DataFrame, dict] List users in a group
```

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_group_users('group_id')
*DataFrame with results*
```

Parameters

- **group_id** (*str*) The ID for the group
- as_df (bool (default True)) Whether to return the response as a pandas DataFrame
- port (int (default 8083)) The API port to use

Returns

users – The response from the API

Return type

pandas DataFrame or dictionary

```
list_groups(as\_df: bool = True, port: int = 8083) \rightarrow Union[DataFrame, dict]
```

List all groups

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_groups()
*DataFrame with results*
```

Parameters

- as_df (bool (default True)) Whether to return the result as a pandas DataFrame
- port (int (default 8083)) The API port for the call

Returns

groups - The response from the API

Return type

pandas DataFrame or dictionary

list_model_feedback(model_id, port=8080)

Not yet implemented

list_model_prediction_feedback(model_id)

Not yet implemented

list_model_predictions(model_id, port=8080)

Not yet implemented

list_model_users($id: str, as_df: bool = True, port: int = 8080$) \rightarrow Union[DataFrame, dict]

List users for a model

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_model_users('model_id')
*DataFrame with results*
```

Parameters

- id (str) The ID for the model
- as_df (bool (default True)) Whether to return the response as a Pandas DataFrame
- port (int (default 8080)) The API port for the call

Returns

model users - The users for the model

Return type

pandas DataFrame or dictionary

list_models($as_df: bool = True, port: int = 8080$) \rightarrow Union[DataFrame, dict]

List models within the platform

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_models()
*DataFrame with results*
```

Parameters

- as_df (bool (default True)) Whether to return the response as a pandas DataFrame
- port (int (default 8080)) The API port for the call

Returns

models – The models

Return type

pandas DataFrame or dictionary

list_prediction_feedback(prediction_id, port=8080)

Not yet implemented

```
list_users(as\_df: bool = True, port: int = 8080) \rightarrow Union[DataFrame, dict]
```

List all users

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.list_users()
*DataFrame with results*
```

Parameters

- as_df (bool (default True)) Whether to return the data as a Pandas DataFrame
- port (int (default 8080)) The API port for the call

Returns

users - The response from the API

Return type

pandas DataFrame or dictionary

```
login(url: Optional[str] = None, port: int = 8080, username: Optional[str] = None, password: Optional[str] = None) \rightarrow None
```

Log in to the platform programmatically. If no url, username, or password are provided, logs in interactively

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.login()
Enter URL: https://platform.squared.ai
Enter Username: your.email@your_domain.com
Enter Password: <hidden>
```

Parameters

- url (str or None (default None)) The URL for the platform API
- port (int (default 8080)) The API port for the call
- username (str or None (default None)) The username
- password (str or None (default None)) The password

property password: str

The password associated with the client

```
remove_user_from_group(group_id, user_id)
```

Not yet implemented

```
share_model_with_group(model_id, group_id, port=8083)
```

Not yet implemented

```
share\_model\_with\_user(model\_id: str, user\_id: str, port: int = 8080) \rightarrow bool
```

Share a model with a user

```
>>> import aisquared
>>> client = aisquared.platform.AISquaredPlatformClient()
>>> client.share_model_with_user('model_id', 'user_id')
True
```

Parameters

- model_id (str) The ID for the model
- **user_id** (*str*) The ID for the user
- port (int (default 8080)) The API port for the call

Returns

success – Whether the action was successful

Return type

bool

```
test_connection(port: int = 8080) \rightarrow int
```

Test whether there is a healthy connection to the platform

```
>>> import aisquared
     >>> client = aisquared.platform.AISquaredPlatformClient()
     >>> client.test_connection()
     Connection successful
     200
         Parameters
            port (int (default 8080)) - The API port for the call
         Returns
            status_code - The status code when checking the health API
         Return type
            int
property token: str
     The token associated with the client
unshare_model_with_user(model\_id: str, user\_id: str, port: int = 8080) \rightarrow bool
     Unshare a model with a user
     >>> import aisquared
     >>> client = aisquared.platform.AISquaredPlatformClient()
     >>> client.unshare_model_with_user('model_id', 'user_id')
     True
         Parameters
             • model_id (str) - The ID for the model
             • user_id (str) – The ID for the user
             • port (int (default 8080)) – The API port for the call
         Returns
            success – Whether the action was successful
         Return type
            bool
upload_model(model\_file: str, port: int = 8081) \rightarrow str
     Upload a model to the platform
    >>> import aisquared
    >>> client = aisquared.platform.AISquaredPlatformClient()
     >>> client.upload_model('my_model_filename.air')
     True
         Parameters
             • model_file (path or path-like) – The path to the model file
             • port (int (default 8081)) - The API port to use
         Returns
            successful – Whether the action was successful
```

Return type

bool

property username: str

The username associated with the client

aisquared.serving package

Module contents

The aisquared serving package contains utilities to serve models to a local REST endpoint.

Here is an example of how to serve a simple keras model using these utilities:

And to retrieve predictions from the model:

```
>>> # From a separate terminal, assume data is already loaded
>>> from aisquared import serving
>>> serving.get_remote_predictions(data) # Do not need to change host or port if_
--predicting from the same machine
*predictions*
```

Submodules

aisquared.serving.deploy model module

```
aisquared.serving.deploy_model.deploy_model(saved_model: str, model_type: str, host: str = '127.0.0.1', port: int = 2244, custom_objects: Optional[dict] = None, additional_functions_file: Optional[str] = None)
```

Deploy a model to a Flask server on the specified host

Parameters

- **saved_model** (*Path-like*) The path to the saved model directory or model file
- **model_type** (*str*) The type of model
- host (str (default '127.0.0.1')) The host to deploy to
- port (int (default 2244)) The port to deploy to
- **custom_objects** (dict or None (default None)) Any custom objects to load when using a MANN model

• additional_functions_file (file-like or None (default None)) — File name containing additional functions (which have to be named preprocess and postprocess, if created) that are used during the prediction process

aisquared.serving.deploy_model.load_mann_model(model: str, custom_objects: dict)

Load a MANN model with custom objects

aisquared.serving.get remote prediction module

```
aisquared.serving.get_remote_prediction.get_remote_prediction(data: Union[dict, str, ndarray, list], host: <math>str = '127.0.0.1', port: int = 2244) \rightarrow list
```

Send data to use for prediction

Parameters

- data (dict, str, np.ndarray, or list) The data to be predicted on
- **host** (*str* (*default* '127.0.0.1')) The host to use
- port (int (default '2244')) The port to use

Notes

- If data is a dictionary, it is expected to already be correctly formatted
- If data is a string, it is expected to already be correctly formatted

Returns

predictions – The predictions from the deployed model

Return type

list

aisquared.utils package

Module contents

Additional utilities to use with the *aisquared* package. These utilities currently consist of two functions, the *mimic_model* and *get_model* functions. They utilize functionality that exists in our open source package BeyondML to train teacher-student models

To see in-depth examples of how to use these functions, please visit our GitHub repository at https://github.com/AISquaredInc/MimicModelExamples

Submodules

aisquared.utils.utils module

aisquared.utils.utils.get_model(model_type: str, input_shape: Union[int, tuple[int]], num_outputs: int, output_activation: str, size: str = 'small', vocab_size: Union[None, int] = None)

Get a pre-configured model for different use cases

Parameters

- model_type (str) Either 'cv', 'nlp_embedding', or 'fc', defining the model type
- input_shape (int or tuple of int) The input shape to the model
- num_outputs (int) The output shape of the model
- output_activation (str or keras activation function) The activation of the final layer of the model
- size (str (default 'small')) One of either 'small', 'medium', or 'large'
- **vocab_size** (*str or None* (*default None*)) Size of the vocab, if model_type is 'nlp_embedding'

Returns

model - The model

Return type

TensorFlow Keras model

aisquared.utils.utils.mimic_model(trained_model: BaseEstimator, nnet: Model, training_data: ndarray, test_data: ndarray, test_labels: ndarray, problem_type: str, loss: str, metrics: Union[str, list], optimizer: str, mimic_proba: bool = False, retention: float = 0.9, batch_size: int = 32, epochs: int = 100, starting_sparsification: int = 0, max_sparsification: int = 99, sparsification_rate: int = 5) \rightarrow Model

Train a sparse neural network to mimic a scikit-learn model

Parameters

- trained_model (sklearn model) The model that is already trained
- **nnet** (*TensorFlow keras Model*) The neural network to train to mimic the trained model
- training_data (array or array-like) The input data that was used to train the trained model
- **test_data** (*array or array-like*) The input data to be used for testing
- test_labels (array or array-like) The output data used in testing
- problem_type (str) The type of problem, either 'classification' or 'regression'
- loss (str or keras loss function) The loss to use
- metrics (str. function or list of str. function) Metrics to measure
- **optimizer** (str or keras optimizer) The optimizer to use
- mimic_proba (bool (default False)) For classification, mimic the probability outputs

- **retention** (*float* (*default* 0.9)) The retention of performance to allow further pruning
- batch_size (int (default 32)) The batch size to use while training
- **epochs** (*int* (*default* 100)) The number of epochs (if early stopping is not met beforehand)
- $starting_sparsification(int (default 0))$ The starting model sparsification
- max_sparsification (int (default 99)) The maximum sparsification to allow
- sparsification_rate (int (default 5)) The sparsification rate when invoked

Returns

nnet – The trained model

Return type

TensorFlow keras Model

TWO

CHANGELOG

• Version 0.1.3

- Added *flags* parameter to *TextHarvester* using regular expression harvesting
- Deleted model_feedback parameter in ModelConfiguration object and included functionality in feedback_steps parameter
- Changed format parameter to header for both deployed analytics
- Added feedback and stages to *DocumentPredictor* and *ImagePredictor* objects
- Non-API changes for ALLOWED_STAGES
- Fixed bugs preventing Windows users from importing the package
- Updated ModelConfiguration to include url parameter
- Changed default tokenization string

• Version 0.2.0

- Moved preprocessing steps under subpackages for specific kinds of preprocessing steps
- Cleaned up documentation to render within programmatic access environments
- Added aisquared.logging subpackage

- Created InputHarvester

- * Allows for harvesting of input text, images, and tabular data
- Created the aisquared.serving subpackage, specifically the deploy_model and get_remote_prediction functions
- Created the GraphConfiguration class
- Added auto-run parameter to ModelConfiguration and GraphConfiguration classes

- Created the aisquared CLI with the following commands:

- * aisquared deploy, which deploys a model locally
- * aisquared predict, which predicts using a local JSON file
- * aisquared airfiles, which contains the subcommands list, delete, download, and upload
- Changed all classes within aisquared.config.analytic to accept 'tabular' as an input type
- Removed aisquared.logging and aisquared.remote from top-level imports
- Added round parameter to Regression postprocesser
- Removed *DocumentPredictor* and *ImagePredictor* classes

- Removed *ChainRendering* class
- Created FilterRendering class
- Altered QUALIFIERS
- Added advanced rendering parameters to rendering objects
- Removed *logging* and *remote* subpackages from top-level *aisquared* import

Version 0.2.1

- Added the S3Connector class to the analytics subpackage, which allows download of an analytic directly from S3
- Updated the documentation and added the docs subdirectory for hosting the documentation on GitHub Pages

• Version 0.2.2

- Fixed bug in to_dict method within ObjectRendering class
- Fixed bug in name of MultiplyValue step
- Fixed bug in datatype checking for text harvester
- Added body_only parameter to TextHarvester
- Added 'underline' to possible badges
- Added threshold_key and threshold_values to relevant rendering classes
- Added *Trim* text preprocessing class
- Added CustomObject in the base package to allow for creation of custom classes
- Added keyword harvesting capabilities
- Added utils subpackage with capabilities to mimic a trained sklearn model
- Small documentation changes
- Changed the required imports for the package to streamline installation process, and created two installation options *aisquared* and *aisquared*[full]

• Version 0.2.3

- Added functionality to add custom preprocessing and postprocessing functions to the model deployment pipeline
- Added all parameter to LocalAnalytic class
- Changed under-the-hood functionality of mimic model function in line with updates to BeyondML
- Altered the ReverseMLWorkflow analytic
- Added the BarChartRendering, ContainerRendering, DashboardReplacementRendering, DoughnutChartRendering, HTMLTagRendering, LineChartRendering, PieChartRendering, SOSRendering, and TableRendering rendering classes
- Added the QueryParameterHarvester harvester class
- Added the *limit* parameter to the TextHarvester class

• Version 0.3.0

- Added type hinting to documentation strings
- Revamped documentation to use Sphinx

• Version 0.3.1

- Changed Python type hints to allow for backwards compatibility with older versions of Python
